GLOSSARY AND ABBREVIATIONS

AHM	Aquatic Habitat Mapping
ANSI	Areas of Natural or Scientific Interest in Ontario
AOI	Area of Interest
BIS	Biodiversity Impact Studies
BPD	Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design
BPPA	Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approaches
BV	Biodiversity Value; The biotic environmental components that will be considered for study within The Project's Biodiversity Impact Studies. A subset of biodiversity values will ultimately be scoped into the Biodiversity Impact Assessment as Valued Components.
CanNorth	Canada North Environmental Services; consultants to the NWMO for the Environmental Media Baseline Program (EMBP)
CNSC	Canadian Nuclear Safety Commission
CSM	Conceptual Site Model
DGR	Deep Geological Repository
eDNA	Environmental DNA
Ecoregion	Second highest level of the ELC hierarchy. Large geographic areas primarily identified by sub-continental climatic regimes and bedrock geology.
Ecosite	Second lowest level of the ELC hierarchy (Crins et al. 2009). The land within an ecosite will generally contain similar substrate and vegetation.
Ecosystem function	In the context of biodiversity, ecosystem functions include the physiochemical and biological processes that occur within the ecosystem to maintain biodiversity.
Ecosystem services	Ecosystem services are the direct and indirect benefits to human well-being that the natural environment provides through healthy ecosystems. Ecosystem services include provisioning services such as the production of food and water, regulating services such as the control of climate and disease, supporting services such as nutrient cycles and oxygen production, and cultural services such as spiritual and recreational benefits. Ecosystem services related to recreation, tourism, aesthetic appreciation, or spiritual enjoyment of nature will be addressed in other IA pillars outside of the BIS.
ELC	Ecological Land Classification
EMBP	Environmental Media Baseline Program
Herpetofauna	The reptiles and amphibians of a particular region, habitat, or geological period.
IA	Impact Assessment
IAA	Federal *Impact Assessment Act*
IAAC	Impact Assessment Agency of Canada
IK	Indigenous Knowledge

LSA	Local Study Area LSA_{TER} = Terrestrial Local Study Area LSA_{AQU} = Aquatic Local Study Area LSA_{ECO} = Local Study Area for Ecosystem Function and Services
Mitigation hierarchy	A tool designed to help limit the negative impacts of development on biodiversity and ecosystem services. Involves a sequence of four key actions – avoid, minimize, restore, and offset – and provides a best practice approach to aid in the sustainable management of environmental resources by establishing a mechanism to balance conservation needs with development priorities.
MNRF	Ontario Ministry of Natural Resources and Forestry
NHIC	Ontario Natural Heritage Information Centre
NSCA	*Nuclear Safety and Control Act*
NWMO	Nuclear Waste Management Organization
Rights-holders	First Nation and Métis communities who have asserted and or hold recognized treaty and/or Indigenous rights and whose traditional territories include the project location.
RSA	Regional Study Area RSA_{AQU} = Aquatic Regional Study Area RSA_{ECO} = Regional Study Area for Ecosystem Function and Services
SAR	Species at Risk
SCC	Species of conservation concern
SON	Saugeen Ojibway Nation
SON-South Bruce siting area	Used to describe the broader area surrounding the defined area within which the Project may be located. The SON-South Bruce siting area is the general area surrounding the Municipality of South Bruce and includes the traditional territory of Saugeen Ojibway Nation (SON) in southwestern Ontario.
SWH	Significant Wildlife Habitat; Defined in the Ontario Provincial Policy Statement, 2020, as: *Wildlife habitat* – areas where plants, animals and other organisms live, and find adequate amounts of food, water, shelter and space needed to sustain their populations. Specific wildlife habitats of concern may include areas where species concentrate at a vulnerable point in their annual life cycle; and areas which are important to migratory and non-migratory species. *Significant* – in regard to wildlife habitat, ecologically important in terms of features, functions, representation or amount, and contributing to the quality and diversity of an identifiable geographic area or natural heritage system
TEM	Terrestrial Ecosystem Mapping
The Project	The Adaptive Phased Management Project is the Deep Geological Repository and other required infrastructure for the safe, long-term management of Canada's used nuclear fuel.
TISG	Tailored Impact Statement Guidelines for Designated Projects Subject to the *Impact Assessment Act and the Nuclear Safety and Control Act*
Ungulate	The term ungulate roughly means "being hoofed" or "hoofed animal". In the context of this report, it includes moose and white-tailed deer.

VC	Valued Component. For impact assessments of designated projects under the *Impact Assessment Act*, the Agency's Glossary of Terms defines VCs as "environmental, health, social, economic or additional elements or conditions of the natural and human environment that may be impacted by a proposed project and are of concern or value to the public, Indigenous peoples, federal authorities and interested parties. Valued components may be identified as having scientific, biological, social, health, cultural, traditional, economic, historical, archaeological and/or aesthetic importance."
WLON	Wabigoon Lake Ojibway Nation

EXECUTIVE SUMMARY

Overview

The Nuclear Waste Management Organization (NWMO) is responsible for implementing the Adaptive Phased Management Deep Geological Repository (DGR) (hereafter 'the Project'), which is Canada's plan for the safe, long-term management of used nuclear fuel, in a manner that protects both people and the environment. The NWMO has retained Zoetica™ Environmental Consulting Services ('Zoetica') to undertake Biodiversity Impact Studies (BIS) for the Project at the two remaining potential locations being considered for the DGR and associated infrastructure. This BIS Baseline Report focuses on the Saugeen Ojibway Nation (SON)-South Bruce siting area[1] near the Township of Teeswater.

The BIS is focused on the study of biodiversity values (BVs) of known or predicted relevance to the potential Project, to ultimately enable impact predictions and optimal application of the mitigation hierarchy[2]. Initial scoping of BVs for the BIS, along with rationale for inclusion, is found in Section 3.1 of the *Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach* (BPPA) Report (Zoetica 2021). The following BVs have been included in the scope of the BIS for baseline study to date:

1. Vegetation
2. Wetlands and Riparian Environments
3. Mammals – Ungulates, Carnivores, Small Terrestrial Mammals, Semi-Aquatic Mammals, Bats
4. Herpetofauna – Amphibians, Reptiles
5. Terrestrial Invertebrates
6. Birds (including migratory birds) – Upland Breeding Birds (including Game Birds), Shorebirds, Waterbirds, Raptors
7. Fish and Fish Habitat – Fish, Primary and Secondary Producers (including aquatic invertebrates)
8. Ecosystem Function and Services

Project Location and Study Areas

The exact location of Project infrastructure in the SON-South Bruce siting area is under development. For the BIS, several study areas were established to ensure that adequate but not extraneous information is collected to support the biodiversity impact assessment (IA). Study areas include the Area of Interest (AOI) which was designed to encompass the extent of anticipated Project activities and impacts, Local Study Areas (LSAs) which consider the distribution of BVs across the landscape, and Regional Study Areas (RSAs) which consider potential cumulative impacts that may occur in the region within the ranges of the BVs. For the BIS, terrestrial and aquatic study areas were designed separately due to the unique considerations

[1] The 'SON-South Bruce siting area' refers to the broader area surrounding the defined area within which the Project may be located, in southwestern Ontario. The 'SON-South Bruce siting area' is located near the Municipality of South Bruce and the traditional territory of the Saugeen Ojibway Nation. The other potential location for the Project is the Wabigoon Lake Ojibway Nation (WLON)-Ignace siting area located in Treaty #3 in the traditional territory of Wabigoon Lake Ojibway Nation, among other Indigenous communities, in northwestern Ontario.

[2] The mitigation hierarchy is a tool designed to help limit the negative impacts of development on biodiversity and ecosystem services. It involves a sequence of four key actions – avoid, minimize, restore, and offset – and provides a best practice approach to aid in the sustainable management of environmental resources by establishing a mechanism to balance conservation needs with development priorities.

of each. Descriptions and rationale for developing these study areas can be found in Section 5.2 of the BPPA Report (Zoetica 2021).

Work Completed

The Project is in early phases of baseline data collection. The BIS follows a tiered approach to baseline studies (see Section 4.2 of the BPPA Report (Zoetica 2021)) and is currently in Tier 1. Tier 1 is focused on collating existing data on the presence of species and known important habitats and collecting foundational habitat information through the following studies:

- Terrestrial Ecosystem Mapping (TEM)
- Aquatic Habitat Mapping (AHM)
- Environmental DNA (eDNA) metabarcoding[3] studies in aquatic habitats
- Opportunistic identification of candidate Significant Wildlife Habitat (SWH) alongside TEM.

To date, Tier 1 field studies have focused on areas within the AOI and terrestrial and aquatic LSAs, as well as select locations within the aquatic RSA and at potential control sites outside of the RSA (for AHM and eDNA studies).

Summary of Findings

Species of Interest

Several types of species of interest were considered during baseline work, including i) species of conservation concern (SCC), ii) species of interest to stakeholders and rights-holders, and iii) invasive species. The consideration of indicator species will be included in future iterations of the baseline report once a formal Project Description has been released and after more information is gathered about potential project impacts and species habitat associations (e.g., through Tier 2 community composition studies) within the BIS study areas. See Section 4.2 of the BPPA Report (Zoetica 2021) for further discussion of indicator species.

Species of conservation concern include federally and provincially listed species at risk (SAR) and provincially rare species that are protected through various federal and provincial regulations. A total of 72 SCC, including 43 SAR and 29 provincially rare species, have been detected (or potentially detected) within relevant BIS study areas. Observations of SCC were collated through searching existing biodiversity databases, studies conducted by the Toronto Zoo's Native Bat Conservation Program, carnivore surveys sent to landowners in the area, Tier 1 eDNA metabarcoding studies, vegetation community assessments through Tier 1 TEM and AHM studies, and incidental observations recorded during AHM, eDNA, and TEM field studies. Up to twenty-two SCC have been detected within the AOI[4]; these include two at-risk plants (black ash and butternut), one provincially rare plant (eastern green-violet), three at-risk species bats (silver-haired bat, eastern red bat, and hoary bat), eight at-risk birds (bald eagle, bank swallow, barn swallow, bobolink, eastern meadowlark, eastern wood-peewee, lesser yellowlegs, and wood thrush), two

[3] In all sections of this 2023 BIS Baseline Report, where eDNA studies and results are noted, they refer to the use of eDNA in combination with metabarcoding for multi-species identification.

[4] To protect sensitive species and ecosystems, spatial data pertaining to provincially tracked (at-risk and rare) species and wildlife concentration areas (e.g., nest colonies) are represented by a 1 km grid, rather than a point or polygon, as per the NHIC's Sensitive Data Location Standards (NHIC n.d.). Counts of SCC within the AOI were based on overlap with the 1 km grid squares, not the actual point or polygon locations. As such, not all 22 SCC were necessarily found within the AOI.

provincially rare birds (upland sandpiper and white-crowned sparrow), three at-risk reptiles (eastern milksnake, midland painted turtle, and snapping turtle), one at-risk terrestrial invertebrates (monarch), one provincially rare terrestrial invertebrate (juniper seed moth), and one provincially rare primary and secondary producer (digger crayfish). In addition, as proposed critical habitat for at-risk rainbow (mussel) exists within the AOI, it is expected that rainbow (provincially listed as Special Concern) also occur in the AOI. Three bat SAR and one vegetation SAR are restricted and thus Zoetica cannot confirm whether they were detected within or outside of the AOI. To date, the remaining 46 SCC have only been detected outside the AOI.

Species of interest to stakeholders and rights-holders include those that have been mentioned during engagement as important to include in the BIS (see Appendix B in the BPPA Report (Zoetica 2021)). To date, only a few species of importance were mentioned by stakeholders and rights-holders and, except for lake whitefish, none have been detected within the relevant BIS study areas. Lake whitefish were only detected in Lake Huron based on desk-based searches of relevant datasets. Engagement to date has largely focused on environmental concerns of stakeholders and rights-holders, and mentions of species were typically related to important habitats rather than species of importance to stakeholders and rights-holders. Engagement is ongoing to ascertain species of importance to stakeholders and rights-holders.

Invasive species are those that are not native to Ontario, or to a part of Ontario, and where the species' introduction or spread threatens the natural environment, human health, or socio-economic values. A total of 20 invasive species, and 41 other weedy or introduced vegetation species were detected within the relevant BIS study areas. Thirteen invasive species were reported in the AOI including eight plant species (broad-leaved cattail, European buckthorn, European reed, purple loosestrife, reed canarygrass, Scots pine, Norway maple, and white sweet-clover), four invertebrate species (common earthworm, red earthworm, emerald ash borer and spongy moth) and one secondary producer (rusty crayfish). Additionally, 20 introduced vegetation species (bittersweet nightshade, orchard grass, Queen Anne's lace/wild carrot, redtop, stinging nettle, sweet cherry, common dandelion, common speedwell, common timothy, English plantain, garden bird's-foot trefoil, lesser burdock, meadow fescue, narrow-leaved cattail, Norway spruce, red clover, soybean, sulphur cinquefoil, water speedwell, and white clover), and six weedy vegetation species (bull thistle, Canada thistle, eastern poison ivy, knapweed spp., smooth bedstraw, and western poison ivy) were reported in the AOI. Additional forest diseases were detected within the BIS study areas, including some with vectors that are classified as invasive. For example, beech bark disease was detected within the AOI, and Dutch elm disease and white pine blister rust were detected in BIS study areas outside of the AOI.

Important Habitat

Several types of important habitats were considered during baseline work, including critical habitat for SAR, confirmed and candidate SWH, and important fish habitat. These habitats are components of the natural heritage features and areas that are protected by the Ontario Provincial Policy Statement under the *Planning Act* (MMAH 2020). Critical habitat is habitat that is necessary for the survival or recovery of a listed wildlife species and that is identified as the species' critical habitat in a federal recovery strategy or action plan for the species. SWH includes seasonal concentration areas, rare vegetation communities, specialized habitat for wildlife, habitat for SCC, and animal movement corridors. Important fish habitat includes habitat required to fulfill important life history phases of fish species, such as for spawning, rearing, overwintering and migration between seasonally important habitats.

Based on desk-based searches of critical habitat identified in recovery strategies and Ontario Natural Heritage Information Centre (NHIC) records for at-risk species, critical habitat belonging to six species exists within the BIS study areas. Proposed critical habitat exist for rainbow within the AOI and extending into the LSA_{AQU}. Critical habitat squares (NHIC masking) for two reptiles (wood turtle and spotted turtle), and two plant species (goldenseal and American ginseng) also overlap with the AOI. Critical habitat squares for wood turtle, spotted turtle, goldenseal, and American ginseng also partially overlap with the LSA_{AQU} and the BV-specific RSAs. Additionally, critical habitat for pugnose shiner was identified in Cargill Mill Pond in the RSA_{AQU}. The habitat regulation for wood turtle (O. Reg. 832/21) under the Ontario *ESA* does not currently apply to areas within the County of Bruce. However, following the mitigation hierarchy with consideration of this habitat regulation may contribute to positive effects of the Project through conservation efforts toward the species' recovery.

Zoetica has documented and mapped SWH already identified and reported through NHIC and Ontario Ministry of Natural Resources and Forestry (MNRF) databases and has mapped candidate SWH through desk-based analyses of ecosites and other habitat criteria, and through the identification of candidate SWH during initial Tier 1 field studies. To date, Zoetica has identified four types of confirmed SWH: Deer Winter congregation Areas, Seeps and Springs, Terrestrial Crayfish, and habitat for barn swallow (Special Concern). Of the confirmed SWH, seeps and springs, barn swallow nesting sites, and terrestrial crayfish chimneys or burrows were observed in the AOI. Seeps and springs and terrestrial crayfish chimneys or burrows were also identified in the LSA_{AQU}. Deer Winter Congregation Areas were mapped by the MNRF in the ungulate-specific RSA and extended into the LSA_{TER} outside of the AOI. In addition to confirmed SWH, there is strong evidence to support candidate SWH (which may become confirmed SWH with additional required studies), including within the AOI, for Bat Maternity Colonies and habitat for two Special Concern or Rare Wildlife Species: snapping turtle and eastern green-violet. Furthermore, SWH types related to amphibians are likely present within the BIS study areas for herpetofauna. Additionally, several other candidate SWH were identified within the AOI, including Woodland Raptor Nesting Habitat, Turtle Nesting Areas, colonially-Nesting Bird Breeding Habitat (Ground), Open country Bird Breeding Habitat, Colonially-Nesting Bird Breeding Habitat (Bank and Cliff), and Shorebird Migratory Stopover Area.

Desk-based information collated to date identified one important fish habitat: a brook trout spawning area on Alps Creek in the southern LSA_{AQU}. Potentially important fish habitats were also identified within the BIS study areas during field-based Tier 1 studies. Several groundwater seeps and springs and riffle habitats were noted during 2022 AHM field studies, including within the AOI. These areas could be used by various fish species for spawning. In addition, many reaches surveyed during AHM studies had suitable riparian and shoreline cover (e.g., coarse woody debris, boulders, in-water vegetation) that can provide good quality rearing habitat. Several deeper pools were also identified in reaches, including within the AOI, which could be used by various species for overwintering. Lastly, during desk-based searches of available datasets and AHM field surveys, many potential barriers and obstacles to fish passage were identified. If the SON-South Bruce study area is selected for the project, these areas may be evaluated further to ascertain whether they could potentially interfere with migratory habitat for fish.

Wetlands and Riparian Areas

Wetlands and riparian areas fulfill a wide range of ecological, hydrological, and biochemical functions and provide unique and specialized habitats for wildlife that depend on these features for various life history phases and movement and migrations through connected, undisturbed habitat networks. In Ontario,

wetlands are considered natural heritage features that require protection and sustainable management. During Tier 1 studies within relevant BIS study areas, Zoetica determined the distribution and prevalence of wetlands and riparian areas through desk-based analyses of ecosites and existing data for Provincially Significant Wetlands. Zoetica also mapped various riparian buffer widths around watercourses and waterbodies that should be retained or enhanced to preserve wetland function into the future.

Ecosystem Function and Services

Ecosystem functions include the physical, chemical, and biological processes within the ecosystem that maintain biodiversity. Ecosystem services are the variety of benefits that nature provides to people, including regulating services (e.g., shading, pollutant removal, regulation of water), provisioning services (e.g., material benefits such as food, water, raw materials, and medicinal resources), and cultural services (e.g., non-material benefits including recreation and mental and physical health) (MEA 2005). Protected lands can provide ecosystem function and services for an area by conserving important habitat for biodiversity and human uses. Zoetica collated spatial data on Areas of Natural or Scientific Interest (ANSIs), Conservation Authority Lands, County and Municipal Lands, and trail networks to map protected lands within the BIS study areas. Zoetica also collated desk-based data on important habitat for supporting BVs, as well as desk- and field-based observations of SCC and any species of interest to stakeholders and rights-holders.

Zoetica also conducted preliminary analyses of regional forest health conditions, as these may inhibit ecosystem function. Several forest pests and diseases were detected within the BIS study areas including ash leaf spot disease, beech bark disease, black knot disease, Dutch elm disease, emerald ash borer, tar spot disease, and white pine blister rust. Beech bark disease, emerald ash borer, and spongy moth were reported within the AOI. Of the forest pests and diseases detected in desk- and field-based data thus far, spongy moth and emerald ash borer may be the greatest causes for forest health concerns. Zoetica also conducted preliminary assessments of riparian habitats, as these areas can provide essential ecosystem functions for a region and are often afforded provincial protections. Approximately half of the riparian buffers were unmapped anthropogenic areas, and the remaining buffers were predominantly forested areas with lesser proportions of meadows, plantations and shrublands. These proportions suggest that many wetlands, watercourses, and waterbodies in the BIS study areas have some good quality and some poorer quality riparian habitat. Zoetica recognizes that wetlands and riparian areas can provide important habitat for biodiversity and important regulating services which benefit people. Additional information collected through other environmental and social programs may assist in assigning relative importance of these areas to biodiversity and humans. Thus, the BIS program will continue to examine habitats that can increase ecosystem functioning, benefit biodiversity, and provide important services for humans.

Next Steps

Initial Tier 1 and select Tier 2 BIS studies, other environmental studies conducted as part of the Environmental Media Baseline Program (EMBP) designed by CanNorth (CanNorth 2020), and additional studies on the human, social, and economic aspects, will altogether inform the site selection process for the Project. Tier 1 studies will continue in the future (anticipated in 2024) at the SON-South Bruce site. In addition, once a site has been selected with a willing host community, the BIS will continue with additional Tier 1 studies and proceed with collecting Tier 2 biodiversity data at the selected site.

Additional Tier 1 studies at the selected site may include, for example, extending TEM to the RSA to collect relevant data for determining important species habitat associations for select species, for determining

the relative proportion of available high-quality habitat in the various BIS study areas, and for selecting appropriate control sites. eDNA metabarcoding studies may continue and include repeated seasonal sampling to enable occupancy modelling, identify biological hotspots within the BIS study areas, and detect cryptic species that may not be as easily detected through traditional methods.

Tier 2 studies at the selected site will focus on collecting data to understand community and population metrics for biodiversity (e.g., relative abundance, species richness or diversity) within relevant BIS study areas. These data will be important for determining the overall effects (impacts and positive effects) of the Project on biodiversity. Tier 2 studies will also prioritize data collection for species of interest including SAR, species of importance to stakeholders and rights-holders determined through engagement with the relevant communities, and species that can act as indicators of ecosystem health.

1.0 OVERVIEW

Zoetica™ was retained by the Nuclear Waste Management Organization (NWMO) to undertake Biodiversity Impact Studies (BIS) within two potential locations that are being considered for the long-term deep geological storage of Canada's used nuclear waste. The BIS focuses on studying biodiversity values (BVs) of known or predicted relevance to the Adaptive Phased Management Project (hereafter, 'the Project') at each potential site to ultimately enable impact predictions and optimal application of the mitigation hierarchy for the Impact Assessment (IA) to control impacts and enhance benefits, where possible.

Major BIS deliverables by Zoetica include:

1. A *Best Practices and Preferred Approaches (BPPA) Report* for biodiversity studies (Zoetica 2021);
2. A *Baseline Program Design (BPD) Report* with detailed Standard Operating Procedures (Zoetica 2022a);
3. **Baseline reports highlighting an accumulating knowledge of the conditions of the proposed Project site and surrounding area as they relate to biodiversity (Current report);**
4. A biodiversity Change Assessment Memo flagging potential impacts and solutions (Compendium memo report), which draws from baseline information in #3 (Zoetica 2022b); and
5. Contributions to a formal IA under the *Impact Assessment Act* (2019) (Future date, contingent upon the outcome of the site selection process).

The current report is the first iteration of deliverable #3: the 2023 BIS Baseline Report for the Saugeen Ojibway Nation (SON)-South Bruce siting area.

Zoetica will release periodic baseline reports alongside reports on potential impacts, recommended mitigation (deliverable #4), and opportunities for benefits. The comprehensiveness of each subsequent report will increase over time, concomitant with increased learning about the site, refined Project engineering, regulatory inputs, and important social, economic, and health considerations addressed as part of the overarching IA for the Project. For the present 2023 BIS Baseline Report, Zoetica has included a comprehensive Table of Contents that reflects the required biodiversity information indicated within the Tailored Impact Statement Guidelines (TISG) Template for Designated Projects Subject to the *Impact Assessment Act* (*IAA*) and the *Nuclear Safety and Control Act* (*NSCA*) (IAAC 2020) (hereafter, 'nuclear TISG Template'). Recently this Template was removed from the Impact Assessment Agency of Canada (IAAC) website because the IAAC and the Canadian Nuclear Safety Commission (CNSC) are developing a new template for nuclear projects that integrates the licensing requirements under the *NSCA*. The new template will mirror the updated version of the generic TISG Template (IAAC 2022) (hereafter, 'TISG Template') and integrate CNSC's regulations. The 2022 generic template is available on the IAAC website and referenced throughout this 2023 BIS Baseline Report. When the new template for nuclear projects becomes available (anticipated in 2024), Zoetica will reference that document in future iterations of the BIS Baseline Report. The TISG Template will be supplanted by a project-specific TISG according to the prescribed IA process outlined by the IAAC. Appendix C of Zoetica's BPPA Report (Zoetica 2021) lists the elements of the nuclear TISG Template that are relevant to the BIS, along with the requirements that will likely need to be addressed for the final IA.

Producing iterative baseline reports and assessing the Project for potential interactions with biodiversity values will facilitate a growing knowledge of the biodiversity values in the SON-South Bruce siting area that the Project could negatively or positively impact. This iterative process will also enable the continual improvement of future field programs by identifying data gaps and important areas/issues needing more study. Baseline studies will provide a growing database of information about current conditions that communities can consider when evaluating the merits/benefits and risks of the Project. Iterative reports will allow for the early identification of potential environmental challenges, input from affected communities, experts, and regulators, and the mitigation hierarchy to be applied throughout all stages of the Project.

1.1 Report Organization

As aforementioned, the 2023 BIS Baseline Report for the SON-South Bruce siting area is organized to follow the former nuclear TISG Template (IAAC 2020), which mirrors the updated generic TISG Template (IAAC 2022) discussed herein. Section 8.0 of the TISG Template (IAAC 2022) outlines a list of elements within the existing biophysical environment setting that could be scoped into the baseline program. The Baseline Report is organized such that it can be cross-referenced with Section 8.0 of the TISG Template as it relates to biodiversity. Several sections within Section 8.0 of the TISG Template are not within the scope of the BIS (e.g., groundwater, water chemistry), and are being addressed by other contractors to the NWMO and/or NWMO staff with different discipline-specific expertise. For example, the NWMO has retained Canada North Environmental Services ('CanNorth') to design the environmental media baseline program (EMBP) for the Project (CanNorth 2021). Environmental components to be studied through the EMBP include surface water quality, soil and sediment quality, hydrology, shallow groundwater, air quality, noise and light, and tissue samples for baseline concentrations of pollutants. These environmental components (excluding tissue samples) represent the abiotic environment upon which living organisms depend. As potential impacts on and benefits to BVs selected for inclusion in the BIS could occur through the alteration of the abiotic environment, the EMBP will inform the BIS.

Only sections of the TISG Template relevant to biodiversity are reported in the 2023 BIS Baseline Report. **Table 1-1** outlines the elements in the TISG Template that relate to biodiversity, the BVs considered within these themes, and where they are addressed within this report. Chapter 1 (this Chapter) includes a general introduction to the Project as it relates to biodiversity and information relevant to all chapters (e.g., study areas). This Chapter also includes appendices containing the quality rating of datasets used, and the results of Tier 1 studies that are currently available. Appendices included are as follows:

1. Appendix A: Dataset Quality Rating
2. Appendix B: Terrestrial Ecosystem Mapping (TEM)
3. Appendix C: Significant Wildlife Habitat (SWH)
4. Appendix D: Aquatic Habitat Mapping (AHM)
5. Appendix E: Environmental DNA Studies (eDNA)

Each BV chapter draws from the data reported within these appendices, where relevant, and includes additional BV-specific information from desk-based searches of existing databases and BV-specific studies.

Table 1-1. Overview of TISG themes and Baseline Report chapters.

Tailored Impact Statement Guidelines Template Header	**Biodiversity Value**	**Chapter Number[1]**
Species at Risk	All BV Chapters	All
Vegetation	Habitat – TEM	Chapter 1
	Vegetation	Chapter 2

Notes:
[1]Appendices to Chapter 1 include reports of Tier 1 studies: TEM = Appendix B; SWH = Appendix C; AHM = Appendix D; eDNA = Appendix E.

2.0 INTRODUCTION

The NWMO is responsible for safe long-term management of Canada's used nuclear fuel. The NWMO recommended Adaptive Phased Management as their preferred approach for developing a deep geological repository (DGR) for the long-term storage of used nuclear waste, and the federal government accepted this recommendation in 2007 (Nuclear Waste Management Organization 2005, NWMO 2010). The site selection process began in 2010 and has required that communities take the initiative and move through a collaborative process involving interested communities, First Nation and Métis communities, and surrounding municipalities.

The site selection process began with 22 municipalities and Indigenous communities that expressed interest in learning about and exploring their potential to host the Project. Since 2010, the NWMO has narrowed their focus on fewer areas based on technical site evaluations and social engagement to assess the safety and potential to build supportive and resilient partnerships. At present, site selection for the Project involves two locations, the first of which is the focus of the present report:

1. The SON-South Bruce siting area in southwestern Ontario, and

2. The Wabigoon Lake Ojibway Nation (WLON)-Ignace siting area in northwestern Ontario.

Multi-disciplinary teams of independent, expert consultants were retained by the NWMO to design data collection programs to characterize the existing environment ("Baseline Programs"). Zoetica was retained to design and undertake biodiversity impact studies. The BIS baseline program focuses on studying biodiversity values of known or predicted relevance to the Project in both potential siting areas. These BVs may become topics which are included in one or more valued component (VCs) which will be studied in the impact assessment, and studies of BVs will enable impact predictions and optimal application of the mitigation hierarchy. This baseline information builds on previous studies (see Section 2.3) and will be used to inform decision-making.

Early baseline information will feed into impact studies that support decision-making by both communities and the NWMO. The early production of assessment documents will also assist in the timely implementation of the mitigation hierarchy, should the site be selected. If the site is selected, a federal IA process would need to be undertaken under the *Impact Assessment Act* (IAA; 2019), which may require additional baseline data collection to meet the project-specific TISG issued by the IAAC. As a project-specific TISG document has not yet been developed, the BIS program has been designed to follow the TISG Template, which will be supplanted by a project-specific TISG according to the prescribed IA process outlined by the IAAC. The TISG Template recommends considerations for selecting VCs for an IA and outlines a list of elements within the existing biophysical environment setting that could potentially be scoped into the baseline program (IAAC 2022). Zoetica has reviewed elements listed in the TISG Template that are relevant to biodiversity and included these elements in the design of baseline studies (see Section 3.0 of Zoetica's BPPA Report (Zoetica 2021) for more information on baseline scoping). Relevant elements for the BIS include:

- Riparian and wetland environments
- Vegetation (including soils)
- Fish and fish habitat
- Birds, migratory birds and their habitat

- Terrestrial wildlife and their habitat
- Species at risk

Relevant components of the nuclear TISG Template, along with requirements for each component, are presented in Appendix C of Zoetica's BPPA Report (Zoetica 2021).

BVs scoped into the BIS baseline program include those listed in **Table 1-1**.The list may be further refined during the review of habitat information collected during baseline studies by investigating species' habitat requirements and the prevalence of these habitat features within the SON-South Bruce siting area. This refinement would exclude species or SAR that are limited to habitat types within the SON-South Bruce siting area that would have no potential for interaction with the Project. Appendix E of Zoetica's BPPA Report (Zoetica 2021) provides a table of laws and regulations relevant to biodiversity that were also considered in the scoping of BVs into the BIS baseline program.

The BIS baseline program design follows a tiered approach as outlined in **Figure 2-1** and detailed in Section 4.2 of Zoetica's BPPA Report (Zoetica 2021). Zoetica began the tiered approach by collating desk-based information. Tier 1 field data collection was initiated in June 2022 by field data collection teams contracted by the NWMO and followed Zoetica's Baseline Program Design Report ('BPD Report'; (Zoetica 2022a). Tier 1 studies focus on collecting habitat information (terrestrial and aquatic), incidental observations, and aquatic eDNA to establish initial evidence of species detections. These data were received by Zoetica from the field data collection contractors for inclusion in the 2023 BIS Baseline Report. Additional Tier 1 baseline data are anticipated to be collected by field data collection contractors in the future (planned for 2024) to fill identified Tier 1 data gaps. Should the SON-South Bruce site be selected, data from Tier 1 studies will be used to inform the Tier 2 baseline program designs, which are specific to BVs. In turn, the Tier 2 baseline program information will inform the Tier 3 program design, if warranted, as the program moves from a relatively broad to specific scope.

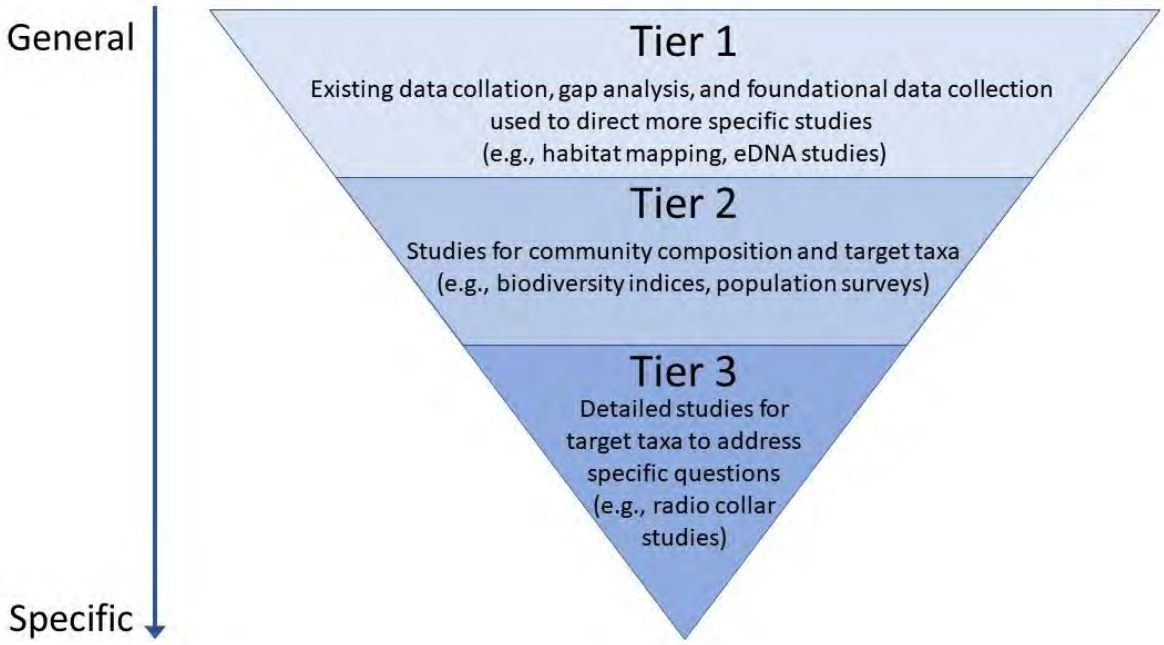

Figure 2-1. Graphical representation of the tiered approach for planning the BIS Baseline Program. Tier 1 studies involve more general information collection with increasing specificity and focus in Tiers 2 and 3. Tier 1 studies focus on collecting foundational and broadly applicable data that will be used to support, justify, inform, and plan future Tier 2 and Tier 3 studies.

2.1 Goals and Objectives

The goals and objectives of the 2023 BIS Baseline Report are to:

1. Present preliminary (Tier 1) baseline information on the presence and distribution of habitats and areas of ecological importance to BVs and key species of interest (e.g., SAR, rare species, species of interest to stakeholders and rights-holders[5], invasives) within BV-specific study areas (see Section 3.0 for study areas and descriptions);
2. Provide community-level species composition (i.e., number of species) data, where possible, to indicate areas within the BIS study areas (see Section 3.0) that may host more or fewer species; and
3. Provide analytical products (e.g., maps, species lists) that can be used to
    a. further design focused and statistically sound studies in subsequent years;
    b. support engagement regarding values, concerns, and next steps in the BIS program; and
    c. help to inform infrastructure design and placement.

[5] As the NWMO has yet to identify a preferred site, it is acknowledged that the Impact Assessment process has not been initiated, and the Duty to Consult has not been triggered. The NWMO has been and will continue to engage with potentially impacted Indigenous peoples as the IAAC does not delegate its Duty to Consult. Throughout this document, the term stakeholder has been used to identify community members, agencies, private entities, while rights-holder has been used to identify Indigenous peoples and communities (i.e., First Nations and Métis).

Additional Tier 1 field data from subsequent field seasons will be included in future iterations of the BIS Baseline Report. If the SON-South Bruce siting area is selected for the Project, Tier 2 studies will be implemented to address the requirements of the Project-specific TISG when it is developed. Zoetica's BPPA Report (Zoetica 2021) proposes potential Tier 2 studies that will be required to meet the requirements of the TISG Template. Future baseline studies are designed to:

1. Establish the functioning of ecosystems and the biodiversity they support to understand the potential impacts and benefits of the Project;
2. Demonstrate how stakeholder and rights-holder concerns and aspirations are addressed; and
3. Provide additional baseline data to help inform the Project's biodiversity IA and mitigation measures and to assist in the potential development of monitoring program(s) to address environmental, regulatory, and stakeholder/rights-holder concerns.

2.2 Project Description

2.2.1 Project Location

The SON-South Bruce siting area is the broader area surrounding the defined area within which the Project may be located. For this report, the term 'SON-South Bruce siting area' describes the general area surrounding the Municipality of South Bruce and includes the traditional territory of the Saugeen-Ojibway Nation (SON) in southwestern Ontario (see **Figure 2-2**).

The exact location of the Project infrastructure is under development. Within the SON-South Bruce siting area, an Area of Interest (AOI) was developed (see Section 3.1 for further detail). According to Ontario's Ecological Land Classification (ELC) System, the SON-South Bruce siting area and AOI are located within the Mixedwood Plains Ecozone and the Lake Simcoe-Rideau Ecoregion (6E). The AOI along with its context relative to various ecoregions, communities, roadways, and ecological features, is presented in **Figure 2-2**. **Figure 2-3** shows the lakes, rivers, and watershed boundaries in the SON-South Bruce siting area.

2.2.2 Conceptual Site Model

No detailed Project Description is currently available for the Project. However, the Project's conceptual preliminary design was prepared by the NWMO and can be found in *Deep Geological Repository Conceptual Design Report Crystalline/Sedimentary Rock Environment* (Naserifard et al. 2021). A *Preliminary Conceptual Site Model* (CSM) was then developed by CanNorth along with their EMBP and includes a description of the project components (CanNorth 2021). Most recently, CanNorth produced an updated CSM in their *Biophysical Conceptual Site Model Update and Screening Level Change Assessment* (CanNorth 2023). Zoetica used this CSM to make assumptions about the Project (e.g., regarding project components and their overall sizes) needed for designing the BIS Program. Impacts and benefits of relevance to the EMBP will also be relevant to the BIS Program (e.g., impacts due to Contaminants of Potential Concern could lead to decreased survival and reproduction of BVs). Therefore, pathways linking the CSM to the EMBP have also been considered in determining how the Project could interact with BVs and ecosystem function and services. Section 2.3 of Zoetica's BPPA Report (Zoetica 2021) includes a review of work to be completed as part of the EMBP. Impacts on and benefits to social, economic, or health values will also need to be considered for their potential to impact BVs and ecosystem function and services.

2.3 Previous Environmental Studies for the Project

The BIS baseline program designed by Zoetica seeks to build on environmental data available in the SON-South Bruce siting area, wherever possible. Available datasets include past work and information gathered for the Project by the NWMO with support from contractors who are experts in their field, Big Unobstructed Databases, and government sources. A review of previous biodiversity and related work in the SON-South Bruce Area is detailed in Section 2.0 of Zoetica's BPPA Report (Zoetica 2021).

2.4 Engagement for Biodiversity Impact Studies

A full discussion of community engagement to date is found in Zoetica's BPPA Report (Zoetica 2021). A brief overview is provided here.

The Project will only proceed with the involvement of rights-holders (i.e., First Nation and Métis communities) and stakeholders in the area and surrounding communities. These parties working together to implement the Project is integral for the success of the BIS. The underlying participatory approach to the broader environmental baseline program is one of continuous learning. The program will be updated as more is learned from the communities and the data collected. It will evolve as a co-designed program in collaboration with diverse stakeholders and rights-holders. Engagement with the communities in the SON-South Bruce Area has begun (see Section 1.4 of Zoetica's BPPA Report (Zoetica 2021)) and ongoing engagement is planned to discuss environmental concerns of stakeholders and rights-holders surrounding the SON-South Bruce siting area. Any local knowledge and/or Indigenous Knowledge (IK) shared will be used and documented as the knowledge holders see fit and following the NWMO's IK policy (NWMO 2016). Feedback will be interwoven into the BIS' early planning phases (e.g., at each Tier of study). Information learned through initial stages of study is shared with the communities, and concerns regarding potential effects of the Project on the surrounding biodiversity can be systematically addressed in the BIS, consistent with the NWMO's IK policy (NWMO 2016).

The TISG Template requires that the list of VCs ultimately selected for the IA will be informed through engagement with the public, Indigenous communities, lifecycle regulators, jurisdictions, federal authorities, and other interested parties. The rationale for inclusion (or exclusion) of VCs must consider environmental, cultural, spiritual, historical, health, social, economic, recreational, and aesthetic considerations, and IK. The value of a component, including biodiversity, depends on its intrinsic function in the ecosystem and the extrinsic value placed on it by local and Indigenous communities.

Engagement sessions with stakeholder and rights-holder groups were conducted in 2020 to solicit feedback on what is important to local communities and stakeholders regarding the environment, perceived impacts and benefits, and values of importance for baseline study. Stakeholder and rights-holder concerns raised in 2020 that are related to biodiversity are summarized in Table 1-2 of Appendix B of Zoetica's BPPA Report (Zoetica 2021). A complete discussion of feedback from engagement conducted to date is available in Section 1.4 of Zoetica's BPPA Report (Zoetica 2021). Additional community feedback will be sought on an ongoing basis and included with each iteration of the BPPA report.

3.0 STUDY AREAS

For the BIS, several study areas were established to ensure that adequate, but not extraneous information is collected to support the biodiversity IA. Study areas were designed conservatively to encompass the farthest potential extent of anticipated Project activities and effects (both negative impacts and benefits)

while also considering the distribution and potential movement of BVs across the landscape. The design of study areas also considered potential cumulative impacts that may occur in the region within the ranges of the BVs. For the BIS, the terrestrial and aquatic study areas were designed separately due to unique considerations of each. **Table 3-1** outlines the local and regional study areas for each BV. The AOI applies to all BVs. A brief description of the study areas and their development and purpose is presented below. Section 5.2 of the BPPA Report (Zoetica 2021) contains a full description and rationale for developing these study areas.

Table 3-1. Local (LSA) and regional (RSA) study areas used for each BV.

Biodiversity Value	LSA Name	LSA Area (ha)	RSA Name	RSA Area (ha)	Relevant Sections of BPPA Report for Rationale

Chapter 9: Ecosystem Function and Services					
Ecosystem Services	LSA_{ECO}	27,879	RSA_{ECO}[1]	186,893	Section 5.2.12.4; Figure 5-12

Notes:

[1]Wetland and Riparian Environments is included in Section 5.2.12 (Ecosystem Function and Services) of the BPPA Report and is reported in its own chapter (Chapter 3) within the BIS Baseline Report to match the elements outlined in the TISG Template. The RSA for Wetlands and Riparian Environments differs from the RSA for Ecosystem Function and Services because effects of the Project on wetlands and riparian environments are not anticipated to extend outside of the LSA_{ECO}. the RSA_{AQU} is included for Wetland and Riparian Environments to capture habitat information needed to assess impacts to other BVs that use these areas.

[2]Semi-aquatic invertebrates are included in Section 5.2.9 (Terrestrial and Semi-aquatic Invertebrates) of the BPPA Report and are presented in the Fish and Fish Habitat Chapter (Chapter 8) of the BIS Baseline Report.

3.1 Area of Interest (AOI)

The AOI is an oval shaped polygon that is approximately 8.6 km long and 4.3 km wide, with an area of approximately 18.2 km^2 (1,827 ha). The AOI is located northwest of the community of Teeswater and south of the Greenock Swamp Wetland Complex (**Figure 3-1**). The AOI includes land acquired by the NWMO along with other privately owned lands. The exact location of the Project infrastructure, if it were to be in the SON-South Bruce siting area, is currently under development but will be contained within NWMO owned/optioned lands within the AOI. The AOI includes an area necessary to maintain design flexibility for the Project into and beyond the IA stage. The AOI is consistent for all BVs discussed in this report. A more detailed description of the proposed location and associated project infrastructure can be found in Section 1.1 of the EMBP Design document (CanNorth 2021).

The data objectives for studies within the AOI mainly focus on determining how the potential Project footprint and associated infrastructure could directly impact terrestrial and aquatic habitats, and species that depend on these habitats.

3.2 Local Study Areas

Three local study areas (LSAs) have been established for the BIS: a terrestrial LSA (LSA_{TER}), an aquatic LSA (LSA_{AQU}), and an LSA for the study of ecosystem services (LSA_{ECO}). The LSAs were developed to enable consideration of the extent to which Project impacts and benefits would potentially extend beyond the immediate project footprint. Examples of project impacts expected to extend beyond the project footprint include dust, noise, vibration, and water inputs. A brief description of each LSA is provided below and the size of each LSA is reported in **Table 3-1**. All LSAs include the entire AOI. Additional information and rationale on the development of each LSA can be found in Zoetica's BPPA Report (Zoetica 2021).

3.2.1 LSA_{TER}

The LSA_{TER} is bounded by a 1 km buffer around the AOI (see **Figure 3-1**). This study area was developed by considering the design considerations in the CSM and the anticipated extent of indirect effects (e.g., due to dust deposition, noise, and vibration). Data objectives for studies carried out within the LSA_{TER} are primarily driven by potential project interactions and the possibility for localized cumulative effects on terrestrial BVs.

3.2.2 LSA_{AQU}

The LSA_{AQU} is defined using a watershed approach and is bounded on the west by the Greenock Creek–Teeswater River quaternary watershed boundary and the Teeswater River Outlet quaternary watershed boundary. It is bounded to the south by the Greenock Creek–Teeswater River quaternary watershed boundary (see **Figure 3-1**). The LSA_{AQU} includes all areas that drain into the Greenock Swamp Wetland Complex and the Teeswater Wetland Complex, except for tributaries upstream of the Project site that drain into these wetlands on the east and south sides (see **Figure 3-1**). The LSA_{AQU} was designed to capture potential impacts on and benefits to aquatic and semi-aquatic BVs. This study area was developed by considering both the design considerations in the CSM and general water flow direction. Data objectives for studies conducted within the LSA_{AQU} are primarily driven by potential project interactions and localized cumulative effects on aquatic BVs and on BVs that rely on aquatic habitats to fulfill various life history requisites.

3.2.3 LSA_{ECO}

The LSA_{ECO} was designed to encompass the outermost boundary of the LSA_{TER} and LSA_{AQU} combined (see **Figure 3-1**). The LSA_{ECO} enables a local evaluation of overall ecosystem function and services (values that ecosystems provide for human benefit) that could be affected by the Project. Data objectives for studies conducted within the LSA_{ECO} are primarily driven by potential project interactions and localized cumulative effects on ecosystem function and services, including relevant ecosystems (e.g., wetlands) that may be impacted by both terrestrial and aquatic influences.

3.3 Regional Study Areas

Regional study areas (RSAs) have been established for the BIS on a BV-by-BV basis for BVs that are better assessed over a larger geographic range and BVs whose populations or habitat could be affected by the Project. The BV-specific RSAs are large enough to provide a regional context of terrestrial and aquatic habitat in the SON-South Bruce siting area, provide suitable control sites for habitats within the AOI, and account for the movements of wide-ranging species. Tailored RSAs were designed for BVs that occur or have the potential to occur in and around the Project and have the potential to interact with the Project. These BV-specific RSAs will be used to assess potential cumulative effects in the IA.

3.3.1 BV-Specific Terrestrial RSAs

BV-specific terrestrial RSAs are presented in **Figure 3-2**, and the size of each RSA is reported in **Table 3-1**. RSA boundaries for terrestrial BVs were established by considering annual home ranges of potential species within each BV group, using the most conservative (largest published) range to calculate the BV-specific RSA (see Zoetica's BPPA Report; (Zoetica 2021). Each BV-specific RSA represents a broader study area that provides a regional context for the distribution of wildlife and the ecosystems on which wildlife populations depend. Each RSA also represents the broader area needed to support populations of species that migrate and move through their annual life histories. Potential Project impacts and benefits relating to regional wildlife habitat will be assessed at the RSA scale. More information and rationale on the development of the BV-Specific terrestrial RSAs can be found in Zoetica's BPPA Report (Zoetica 2021).

3.3.2 Aquatic RSA (RSA_{AQU})

A single aquatic RSA (RSA_{AQU}) was designed for all aquatic and semi-aquatic BVs (see **Figure 3-3**). The RSA_{AQU} was delineated using a watershed approach. The RSA_{AQU} contains all water that flows into the Greenock Swamp Wetland Complex, the Teeswater Wetland Complex, and waters downstream of these wetlands. Downstream areas include portions of the Teeswater River, and the Saugeen River downstream of its confluence with the Teeswater River, to the outlet of the Saugeen River into Lake Huron. The RSA_{AQU} also includes a conservative buffer of a 500 m radius into Lake Huron at the outlet of the Saugeen River. More information and the rationale for including these areas in the RSA_{AQU} is found in Zoetica's BPPA Report (Zoetica 2021). The size of the RSA_{AQU} is reported in **Table 3-1**. The RSA_{AQU} is designed to be large enough to provide a regional context of habitat in the SON-South Bruce siting area and to provide suitable control sites for habitat within the AOI and LSA_{AQU}. Additional areas outside of the Saugeen River tertiary watershed may be used as control sites if additional control sites are required or if no suitable control sites exist in the Saugeen River tertiary watershed. More information and rationale on the development of the RSA_{AQU} can be found in the BPPA Report (Zoetica 2021).

3.3.3 RSA_{ECO}

The RSA_{ECO} was designed to encompass the largest of all areas used to study species and guild-specific BVs; to enable a regional evaluation of overall ecosystem function and services (values that ecosystems provide for human benefit) that could be affected by the Project; and to enable the selection of control sites for other habitats (e.g., wetlands) that may be impacted by both terrestrial and aquatic Project pathways. Additional areas outside the RSA_{ECO} may be used as control sites if no suitable control sites exist within the RSA_{ECO} (e.g., control sites for the Greenock Swamp Wetland Complex). The RSA_{ECO} is bounded by the outermost extent of the terrestrial RSAs (RSA_{VEG} being the largest) and the RSA_{AQU} (see **Figure 3-3**). The size of the RSA_{ECO} is provided in **Table 3-1**. More information and rationale on the development of the RSA_{ECO} can be found in Zoetica's BPPA Report (Zoetica 2021).

ORN	Ontario Road Network
ORWN	Ontario Railway Network
OWB	Ontario Watershed Boundaries
OWES	Ontario Wetland Evaluation System
PC	Plant Community
PIN	Personal Identification Number

StatCan	Statistics Canada
SAM	Semi-Aquatic Mammals
SARA	Species at Risk Act
SARO	Species at Risk in Ontario
SOLRIS	Southern Ontario Land Resource Information System
SVCA	Saugeen Valley Conservation Authority
SWOOP 2020	South Western Ontario Orthophotography Project
UNEP-WCMC	United Nations Environment Programme - World Conservation Monitoring Centre
USGS	United States Geological Survey
UTM	Universal Transverse Mercator
WCA	Wildlife Concentration Area
WDPA	World Database on Protected Areas
WMU	Wildlife Management Unit

APPENDIX A - DATASET QUALITY RATING

This appendix summarizes and assesses the quality of all datasets received from external sources used in the Biodiversity Impact Studies (BIS). Only data from external sources outside of data collected as part of BIS studies are assessed for quality because information on the methods used and effort in gathering these data are generally limited. Any datasets used for mapping, reporting, or screening for relevant data for any BIS deliverable (see Section 1.0 of Chapter 1 for BIS deliverables) are included in **Table A-1**. The data quality rubric used to assess the dataset quality, itemized in **Table A-1** under the heading, "Quality Assessment" (Likelihood of Bias, etc.), is presented in Section A.1. Zoetica™ and the NWMO regularly search for relevant data sources and as more datasets are received and included in the BIS, **Table A-1** will be updated in future iterations of the BIS Baseline Report.

Table A-1. Summary of external datasets used for the BIS, including an assessment of their quality. Dataset quality was rated according to the data quality rubric outlined in Section A.1. Files only used as a basemap layer were not assessed for quality and were marked as "N/A" in these columns. Data were ranked from 1 to 5, with 1 indicating the highest score and 5 indicating the lowest. Where similar datasets received the same quality assessment score and assessment results, the columns were merged. Alternating row shading differentiates the datasets with unique data quality ratings.

Abandoned Mines Information System	Habitat	Geodatabase	OGSEarth	2020-03-09	MNRF	1	1	1	1	3	5	5	No	Limited methods information is available. Expertise and review process unknown.	None	Completeness of data not guaranteed; coordinates not intended for navigational, survey, or land title determination.	None
Wooded Area	Habitat	Shapefile	Ontario GeoHub	2019-12-02	MNRF	1	2	1	1	3	5	5	No	Limited methods information is available. Expertise and review process unknown.	None	Open Government Licence – Ontario	None
Ecosite Classification Dataset	Habitat	Shapefile	Sumac Geomatics	2022-03-29	Sumac Geomatics	1	1	1	1	1	1	3	No	The minimum polygon size is 0.5 ha, so smaller units would not be included. Not field verified.	None	None	None
NHIC PC Observation	BV - Veg	Geodatabase	NWMO	2020-02-14; 2020-12-21	MNRF	2	2	1	1	3	1	3	Yes	Observations can be from MNRF staff or submitted to MNRF and reviewed by staff. Observations can include random incidentals and may not indicate a species uses that space (e.g., bird flying overhead)	Cannot prove absence.	See Ministry of Natural Resources Sensitive Data Use Licence Agreement for full limitations. Can only be used for NWMO project. Showing data must follow "Sensitive Data Location Standards". Can only be used by employees who have completed the Data Sensitivity Training. When data are reproduced, should include the text in Other Notes.	Produced under Licence with the Ontario Ministry of Natural Resources and Forestry © King's Printer for Ontario, 2023.
NHIC Species Observation	BV - Various	Geodatabase	NWMO	2020-02-14; 2020-12-21	MNRF												
NHIC PC Occurrence	BV - Veg	Geodatabase	NWMO	2020-02-14; 2020-12-21	MNRF	2	1	1	1	1	1	1	Yes	Occurrences are derived from observations and follow NatureServe guidelines for creation. These represent areas used by the species (e.g., bird nest) and can be considered more 'permanent' than the observations.	Cannot prove absence.	See Ministry of Natural Resources Sensitive Data Use Licence Agreement for full limitations. Can only be used for NWMO project. Showing data must follow "Sensitive Data Location Standards". Can only be used by employees who have completed the Data Sensitivity Training. When data are reproduced, should include the text in Other Notes.	Produced under Licence with the Ontario Ministry of Natural Resources and Forestry © King's Printer for Ontario, 2023.
NHIC Species Occurrence	BV - Various	Geodatabase	NWMO	2020-02-14; 2020-12-21	MNRF												
NHIC WCA Observation	BV - Various	Geodatabase	NWMO	2020-02-14; 2020-12-21	MNRF												
Medium_Sensitive - Wildlife_Activity_Area	BV - Various	Geodatabase	NWMO	2020-12-21	MNRF	2	1	1	1	3	5	5	Yes	Limited methods information is available. Expertise and review process unknown.	None	See "Ontario Ministry of Natural Resources and Forestry ELECTRONIC INTELLECTUAL PROPERTY End-User Licence Agreement" for full limitations. Reproductions should include the text in Other Notes.	Produced under Licence with the Ontario Ministry of Natural Resources and Forestry © King's Printer for Ontario, 2023.
Medium_Sensitive - Wildlife_Activity_Site	BV - Various	Geodatabase	NWMO	2020-12-21	MNRF												
Non_Sensitive - Wildlife_Activity_Area	BV - Various	Geodatabase	NWMO	2020-12-21	MNRF	2	1	1	1	3	5	5	No	Limited methods information is available. Expertise and review process unknown.	None	See "Ontario Ministry of Natural Resources and Forestry ELECTRONIC INTELLECTUAL PROPERTY End-User Licence Agreement" for full limitations. Reproductions should include the text in Other Notes.	Produced under Licence with the Ontario Ministry of Natural Resources and Forestry © King's Printer for Ontario, 2023.
Non_Sensitive - Wildlife_Activity_Site	BV - Various	Geodatabase	NWMO	2020-12-21	MNRF												
Ontario Species List	BV - Various	Excel file	NHIC	2023-05-17	MNRF	1	1	1	1	3	1	5	No	Data includes (internal) review date for S-Rank. Other parts of data may or may not be reviewed.	Includes most up to date subnational, national, and global ranks; however, may not be updated to current SARO, SARA, or COSEWIC statuses.	None	None
Provincially Tracked Species 1km grid	BV - Various	Shapefile	Ontario GeoHub	2019-11-29	MNRF	1	1	1	2	3	1	5	No	As this files is a masked version of NHIC observations data, see relevant rows for quality	Cannot prove absence.	Open Government Licence – Ontario	None

Dataset Details						Quality Assessment							Assessment Results				
Layer Official Name	**Layer Type**	**Dataset Format**	**Received From**	**Received Date**	**Source**	**Likelihood of Bias**	**Reliability**	**Temporal Relevance**	**Geographic Relevance**	**Expertise[1]**	**Data Collection Methods**	**Review**	**Is the Data Considered Sensitive?**	**Assessed Cautions**	**Assessed Limitations**	**Source Caution or Use Limitation[2]**	**Other Notes**
														assessment. No information on review process.			
Karst	BV - Various	PDF Map	OGSEarth	2022-08-19	Ministry of Mines	1	2	3	3	3	5	5	No	The study area overlaps the boundary between inferred and potential karst, so it is not based on measurements and instead based on calculations.	Data only indicates potential for karst, does not confirm presence in the study area.	Information from this publication may be quoted if credit is given.	None
Physiography	BV - Various	Shapefile	OGSEarth	2022-08-19	Ministry of Mines	1	3	1	3	3	5	5	No	Data created at a large scale and may not be detailed enough.	Unclear what methods used and if systematic.	See Metadata.	None
Surficial Geology	BV - Various	Shapefile	OGSEarth	2022-08-19	Ministry of Mines	1	3	1	3	3	5	5	No	Data created at a large scale and may not be detailed enough.	Unclear what methods used and if systematic.	See Metadata	None
EDDMapS Ontario Observations	BV - Various	Geopackage	EDDMapS Ontario	2022-01-12	EDDMapS Ontario	1	1	1	1	3	4	2	No	Not systematically collected, so may not be exhaustive.	Cannot prove absence.	None	None
Global Biodiversity Information Facility Observations	BV - Various	CSV	GBIF.org	2021-10-19	GBIF.org	1	2	1	1	3	5	5	No	Limited methods information is available, so may not be exhaustive. Expertise and review process unknown.	Cannot prove absence.	None	None
Beaver Dam - Discontinued	BV - SAM	Shapefile	Ontario Geohub	2021-10-05	MNRF	1	2	2	1	3	5	5	No	Dataset was retired in 2014 and no longer maintained or supported. No information on expertise, methods, and review. With no methods information, it cannot be determined if data was collected systematically or opportunistically.	This dataset should not be considered extensive or complete, only that it shows beaver dams known to the MNRF in 2014. Dams from before 2014 might be missing, in addition to any changes that occurred after the dataset was retired. Ideally will be replaced with verified field data.	Open Government Licence – Ontario; 2014 Retired – no longer maintained or supported	When using this dataset, a warning of its 2014 retirement should be made.
Aquatic resource area polygon segment	BV - Fish	Geodatabase	Ontario GeoHub	2021-09-07	MNRF	1	1	1	1	3	5	5	No	No information on data collection methods, assumed not systematically collected. Expertise and review process unknown.	Cannot prove absence. Notes:
See the Glossary on page ii for abbreviations used in the table.

1. Expertise for the MNRF was assumed to be a 3 (Data collected by a mix of intermediate and junior scientists in a relevant field) since information on specific staff involved with the data was not available.
2. All datasets received or downloaded for the BIS should only be used for the BIS and other NWMO-related work, so this use limitation was not specified for every file. Also, no files can be shared outside of Zoetica or the NWMO without permission from the original data owner, specified in the received from column.

A.1 Data Quality Scoring

The following data quality rubric was originally presented in Appendix B of Zoetica's *Biodiversity Impact Studies Work Approach* (Zoetica 2021). This rubric provides an explanation of each of the Quality Assessment indicators used in **Table A-1**.

Example of a scoring table adapted for use in evaluating "big data" obtainable from third-party sources for a biodiversity impact assessment (adapted from (UNEP and SETAC 2011). The table may be modified based on the need/use of the data source, and biodiversity value or valued component). The colour coding is as follows: If data are scored with any field that is Red, they could be considered for use (depending on the purpose) but will be interpreted with extreme caution. If data are scored with any field that is Yellow, they will be interpreted and used with caution. Data scored with only Green fields will be used with higher confidence. The data quality scoring for large data collected by third parties will help Zoetica determine the data sources that should be relied on for various purposes. This scoring may lead to the prioritization of certain data sets over others.

Highest ◄——————————————————► Lowest

Data Quality Indicator	1	2	3	4	5 (default)
Likelihood of Bias	Extremely low likelihood of bias[1]	Small possibility of bias	Moderate risk of bias	High risk of bias	Risk of bias cannot be estimated
Reliability	Verified[2] data based on measurements	Verified data based on calculation or non-verified data based on measurements	Non-verified data based on a calculation	Documented estimate (e.g., bin data)	Undocumented estimate
Temporal Relevance[3]	Less than 5 years old (or high relevance)	5-10 years old (high-moderate relevance)	11-15 years old (moderate relevance)	16-20 years old (low relevance)	Age of data unknown or more than 20 years
Geographic relevance	Data from same resolution and same area of study[4]	Within one level of resolution and a related area of study (e.g., if Ground Sample Distance (GSD) uses a pixel size that corresponds to 15x15 m area on the ground, data may be at 30x30 m GSD)	Within two levels of resolution and a related area of study	Outside of two levels of resolution by a related area of study	From a different or unknown area of study
Expertise	Data collected by highly skilled, competent senior researchers in a relevant field	Data collected by a mix of senior and intermediate or senior paired with junior scientists in a relevant field	Data collected by a mix of intermediate and junior scientists in a relevant field	Data collected by junior or inexperienced scientists or other inexperienced personnel in the field	Data collector expertise unavailable, inappropriate, unreported, untrained, or unknown
Data collection methods[5]	Data collection uses a best practice methodology over	Data collection uses a best practice method	Data collection uses a justified methodology that is not considered	Data collected using qualitative, or opportunistic methods	Unknown data collection methods, or data from a small number of sites and

	an adequate period[6]	over a shorter period of time	best practice over a shorter period of time		collected over short periods
Review	Documented reviews by a minimum of two third-party reviewer	Documented reviews by a minimum of one third-party reviewer	Documented review by an internal third-party review		No documented review or unknown

Notes:

[1]Likelihood of bias is qualitatively assessed via a careful consideration of the intended purpose of data collection and presentation and the mandates of groups responsible for data collection. For example, if data are collected and presented by a non-governmental organization with a mandate of stopping development in the boreal forest, might they exaggerate the number of rare species or ecosystem sensitivity in their data presentation? If data are collected by a pro-development organization, might results downplay the ecological importance of an area?

[2]Verification may take place in several ways, e.g. by on-site checking, by recalculation, through crosschecks with other sources.

[3]Temporal age refers to the difference between date of data generation and the date of representativeness as defined by the scope of the project. These definitions may be modified based on the biodiversity value or valued component of interest (and how quickly its distribution changes over time) and the time period that the researchers wish to examine (e.g., if considering past conditions, older data may be more appropriate).

[4]A related area of study is defined by the user and should be documented in the geographical metadata.

[5]Data collection methods include sampling design, study methodology, data (type) collected, technology used, and process of data collection.

[6]Adequate time period can be evaluated as a time period long enough to even out the natural range of variation in the value. The default time is >3 years but will vary based on the biodiversity value being examined.

List of Appendices

List of Figures

List of Tables

List of Appendix Figures

List of Appendix Tables

GLOSSARY AND ABBREVIATIONS

A layer	Tree layer. Divided into three sublayers (A1, A2, and A3).
AOI	Area of Interest
B layer	Shrub layer. B1 = tall shrub layer; B2 = low shrub layer.
BBD	Beech Bark Disease
BIS	Biodiversity Impact Studies
BPD Report	Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design
BPPA Report	Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach
BV	Biodiversity Value
C layer	Herb layer
CWD	Coarse Woody Debris
D layer	Moss, lichen, and seedling layer
DBH	Diameter at Breast Height
E layer	Epiphyte layer
EAB	Emeral Ash Borer
Ecoregion	Second highest level of the ELC hierarchy (Crins et al. 2009). Large geographic areas primarily identified by sub-continental climatic regimes and bedrock geology.
Ecosite	Second lowest level of the Ecological Land Classification (ELC) hierarchy. The land within an ecosite will generally contain similar substrate and vegetation.
Ecosite Grouping	Categorization of ecosites into groups with similar characteristics and habitat function (e.g., conifer forest, hardwood swamp, marsh).
ELC	Ecological Land Classification
Forb	A herbaceous flowering plant that is not a grass, sedge, or rush.
FRI / eFRI	Forest Resources Inventory / Enhanced Forest Resources Inventory
GLSE	Great Lakes Shoreline Ecosystems
GRTS	Generalized Random Tessellation Stratified
GSWC	Greenock Swamp Wetland Complex
IA	Impact Assessment
LSA	Local Study Area LSA_{TER}: Terrestrial Local Study Area LSA_{ECO}: Ecosystem Function and Services Local Study Area

MNRF	Ontario Ministry of Natural Resources and Forestry
NWMO	Nuclear Waste Management Organization
Plantation	Refers to treed plantation for monoculture harvest. A naturalized plantation refers to a treed plantation with >30% ingress and no clear evidence that the site is still being maintained.
RIC / RISC	Resources Inventory Committee / Resources Information Standards Committee
RSA	Regional Study Area RSA_{ECO}: Ecosystem Function and Services Regional Study Area
SON	Saugeen Ojibway Nation
SON-South Bruce siting area	Used to describe the broader area surrounding the defined area within which the Project may be located. The SON-South Bruce siting area is the general area surrounding the Municipality of South Bruce and includes the traditional territory of Saugeen Ojibway Nation (SON) in southwestern Ontario.
SOP	Standard Operating Procedures
SS	Structural Stage
Sumac	Sumac Geomatics; air photo interpreter for the Project at SON-South Bruce
SWH	Significant Wildlife Habitat; Defined in the Ontario Provincial Policy Statement, 2020 as: Wildlife habitat – areas where plants, animals and other organisms live, and find adequate amounts of food, water, shelter and space needed to sustain their populations. Specific wildlife habitats of concern may include areas where species concentrate at a vulnerable point in their annual life cycle; and areas which are important to migratory and non-migratory species. Significant – in regard to wildlife habitat, ecologically important in terms of features, functions, representation or amount, and contributing to the quality and diversity of an identifiable geographic area or natural heritage system.
SWOOP 2020	South Western Ontario Orthophotography Project 2020
TEM	Terrestrial Ecosystem Mapping
The Project	The Adaptive Phased Management Project is the Deep Geological Repository and other required infrastructure for the safe, long-term management of Canada's used nuclear fuel.
Tulloch	Tulloch Engineering Inc.; field work contractors for the Project at SON-South Bruce
TWC	Teeswater Wetland Complex
WWC	Wingham Wetland Complex

1.0 OVERVIEW

To categorize and classify the terrestrial landscape within the Biodiversity Impact Studies (BIS) study areas, Zoetica™ used a combination of Ecological Land Classification (ELC) mapping and Terrestrial Ecosystem Mapping (TEM). Desk-based mapping followed by field surveys will aid our understanding of biodiversity in the terrestrial areas that may be impacted by the Project, if the Saugeen Ojibway Nation (SON)-South Bruce siting area is selected. This Appendix B to Chapter 1 of the 2023 BIS Baseline Report outlines the TEM protocols and preliminary desk- and field- based results.

ELC mapping, developed by the Ministry of Natural Resources and Forestry (MNRF), is Ontario's method for standardized stratification of the landscape into similar units based on ecological features such as terrain, soil, and vegetation communities. Ecosystem maps form the basis for interpreting biological and ecological interactions on the landscape and can provide a means for analyzing the distribution and diversity of ecosystems within a study area. The ELC system classifies Ontario into ecosystem types at various levels of detail and scale (see Figure 2-2 in the *Biodiversity Impact Studies - Southwestern Ontario Region: Baseline Program Design - 2022 Update* (2022 BPD Report; (Zoetica 2022)). The ELC system is divided into four geographic ranges (ELC Working Group 2009). The SON-South Bruce siting area for the Project falls within Ecoregion 6E (Lake Simcoe-Rideau), which is contained within the Southern ELC geographic range.

Mapping ELC data (see Section 3.1.1) can identify potentially limiting/rare ecological features, features of high ecological and human value, and those with sensitivities to anthropogenic changes on the landscape. ELC mapping can also be used to predict interactions between abiotic and biotic ecosystem components. Data created from ELC mapping is then ground-truthed to render it more precise and accurate. Additional valuable information can be gleaned from ecosystem maps, including the application of biodiversity guidelines, riparian guidelines, and various proposed wildlife management strategies.

TEM was outlined by the Resources Inventory Committee (RIC) in British Columbia (RIC 1998), and allows for further refinement of landcover data by including both desk-based mapping products derived from aerial imagery and field-based observations of vegetation and vegetation characteristics at the ground level. It is often difficult to determine understory cover from aerial imagery alone, so combining it with ground-based observations of vegetation structure can give a more detailed overview of vegetation characteristics and homogeneity within a polygon. TEM allows for collecting vegetation attributes (e.g., structural stage and structural composition) that may influence vegetation communities on the landscape and habitat used by wildlife. TEM also allows for the planning of studies to identify rare vegetation communities and wildlife habitats by identifying vegetation attributes that can influence the presence of these values.

1.1 Objectives

The objectives of ecological land classification and TEM mapping for the Project are to:

1. Provide information about the quantity and distribution of different ecosites within the various study areas of relevance (see Section 2.0). These data are used to determine the quantities of

different ecosystem units that may be directly lost[1] in the Area of Interest (AOI) and lost or indirectly impacted within the terrestrial Local Study Area (LSA_{TER}) due to the Project[2].

2. Inform habitat groupings and spatial survey efforts for field surveys of other biodiversity values and statistical survey designs (e.g., selecting randomized, stratified survey locations for use in collecting data via a Generalized Random Tessellation Stratified (GRTS) design for Tier 2 studies).
3. Allow for the future identification of potential associations between habitat features and the presence of terrestrial species and communities detected in Tier 2 baseline studies.
4. Provide additional baseline data to inform infrastructure siting and a potential future Impact Assessment (IA), mitigation measures, and associated monitoring program(s) to address the environmental, regulatory, and stakeholder/rights-holder concerns relevant to the Project.

The initial desk-based ecosite mapping was conducted to provide draft ecosite delineations to identify areas where rare ecosites may be located, provide an overview of habitat for wildlife to complete various life history stages, and identify potentially sensitive habitats (e.g., Significant Wildlife Habitat – see Appendix C, Chapter 1). Initial desk-based ecosystem mapping was also used to select field survey sites for Tier 1 baseline studies by grouping sites by ecosite and randomly assigning survey type to each ecosite polygon (see Section 3.2). Field surveys were conducted to improve desk-based mapping by verifying ecosite characterization using soil and/or vegetation characteristics at surveyed plots that are representative of the overall ecosite polygon.

1.2 Best Practice Guidance

A full description of best practices considered for the TEM study design is available in the *Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approaches* (BPPA) *Report* (Zoetica 2021). The *Great Lakes Shoreline Ecosystem Ecosite Keys* (Lee et al. 2021) and *Field Guide to the Substrates of Ontario* (OMNR 2015) were used as best practice guidance for interpreting air photos to classify polygons based on ecosites, and while in the field to re-classify ecosites, where necessary. The *Field Guide to the Substrates of Ontario* was also used as best practice guidance when completing the site and soils description of each survey plot location. The *Standard for Terrestrial Ecosystem Mapping* (RIC 1998) was used as overall guidance for planning ecosystem mapping studies and for overall study design, including both desk-based and field-based mapping. The *Field Manual for Describing Terrestrial Ecosystems 2nd Edition* (BC MFR and BC MOE 2010) was used for determining field methods and protocols.

2.0 STUDY AREAS

The BIS study areas for TEM include the AOI, LSA_{TER}, LSA_{ECO}, and RSA_{ECO} (see Section 3.0, Chapter 1 for study area delineation). The BPPA Report (Zoetica 2021) contains additional details on the rationale for delineating study areas. TEM work done to date has focused only on the AOI, LSA_{TER}, and LSA_{ECO}. Once a site has been selected and a Project Description is available, TEM studies may be extended to the RSA_{ECO}, where relevant, to understand habitat availability for larger ranging species.

[1] Some losses due to Project infrastructure may be permanent and occur during construction of the Project, while other losses may be temporary and occur because of disturbance (e.g., dust, noise, vibration).

[2] Amounts of habitats (ha and %) in the AOI can be compared to amounts in the LSA_{TER} and ecological services and function Local Study Area (LSA_{ECO}), and eventually the Regional Study Area for ecological function and services (RSA_{ECO}), to contextualize the uniqueness and rarity of ecosystems in the AOI relative to the larger local (LSA_{ECO}) and regional areas (RSA_{ECO}).

3.0 METHODS

3.1 Desk-Based Ecosite Refinement and Preliminary Ecological Land Classification Mapping

3.1.1 ELC Classification System and Data Sources

There are various systems used for ELC mapping in southern Ontario. The first ELC system released for southern Ontario was *Ecological Land Classification for Southern Ontario: First Approximation and Its Application* (Lee et al. 1998). This system was based on the principle that ecosites could be derived by establishing recurring patterns among vegetation, soil, and hydrology. The first approximation utilized keys containing nested statements to differentiate and identify ecological communities, which guided the user to the Community Unit. The Community Unit can be further refined to the ecosite and/or vegetation type using the ELC Community Tables.

In 2008, the ELC system was updated to the second approximation: the *Southern Ontario Ecological Land Classification Vegetation Type List* (Lee 2008). The second approximation presents a table that combines the keys and Community Tables into a series of nested categories. The classification is generally the same as the first approximation, with slight changes to the included ecosites and reformatting of all codes.

The Great Lakes Shoreline Ecosystems (GLSE) system was recently introduced as an update to the second approximation (Lee et al. 2021). The GLSE bring in more clear dichotomous keys and are better suited for air photo interpretation. The GLSE are still in draft form but since it is anticipated to be the new ELC system for southern Ontario, and since the Project will extend into the far future and will need to be interpreted over an extended period, the GLSE system was used for ELC mapping in the SON-South Bruce siting area.

The primary data source for ecosystem information in Ontario is the Enhanced Forest Resource Inventory (eFRI) produced by the MNRF; however, this data source is restricted to the Area of the Undertaking in northern Ontario. There are no known ecosite-level data sources that cover the SON-South Bruce siting area. In 2020, the South Western Ontario Orthophotography Project (SWOOP 2020) was flown over areas in southwestern Ontario, including the portions of Ecoregion 6E where the SON-South Bruce siting area is located. These orthophotos were used for air photo interpretation to delineate ELC polygons, which consist of uniform vegetation and soil characteristics.

SWOOP 2020 imagery was captured during spring leaf-off conditions. The air photo interpreter, Sumac Geomatics, classified the ecosites to the finest level of the GLSE system possible with the condition of the imagery. Air photo interpretation was completed with a minimum polygon size of 0.5 ha within the LSA_{ECO}. The classification was limited to the natural and naturalized areas of the LSA_{ECO} and was not completed in anthropogenic areas (e.g., agriculture, roads, dense development). ELC mapping in the BIS RSAs may be conducted in future years once more is known about the project, including valued components that are likely to be considered in the IA. ELC maps in relevant RSAs could then be compared to the LSA_{ECO} map to determine rarity and relative uniqueness of ecosystems within the SON-South Bruce siting area. For the 2023 BIS Baseline Report, Zoetica only presented ecosites that constituted ≥1% of the mapped area within the LSA_{ECO} independently in figures and grouped the remaining ecosites representing <1% of the mapped area within the LSA_{ECO} by ecosite groupings for display in figures. This version of the Baseline Report presents the proportion and distribution of ecosites where mapping has been completed.

See Appendix A, Chapter 1 for data quality scoring.

3.2 Study Design and Survey Site Selection

Zoetica selected refined ecosite polygons for field-verification of ecosites based on land access, either through publicly accessible land or private land with agreements to allow fieldwork (see **Figure B-1**a-f). There was not sufficient land access to randomize the polygons, so all accessible polygons of a suitable size were selected. TEM standards (RIC 1998) guidance recommends that survey intensity be set based on both considerations of the size of the study area and necessity for accuracy in various areas. Typically, the size of the LSA_{ECO} at a survey intensity level 2 would require visitation of 51-75% of polygons with a ratio of 1:17:90 for full, ground, and visual plots, respectively. However, in 2022 access to survey sites was limited to public areas and private land with landowner permission. Within the accessible parcels, Zoetica planned for visits to 100% of polygons for most ecosite types. One ecosite (SWT-Ho2) was overrepresented in the LSA_{ECO} compared to the AOI (0 polygons in the AOI and 72 in the LSA_{ECO}), so only 10 polygons of this ecosite in the LSA_{ECO} were selected for survey. The final number of polygons selected for survey was 538 plots (25% of polygons in the LSA_{ECO}), at a ratio of 9:11:80 full:ground:visual plots (see **Figure B-1**a-f for distribution of full:ground:visual plots). However, field crews were not able to visit all plots planned for survey in 2022 (see **Table 3-1**). Survey intensity may be improved and brought closer to TEM standards in future years, should the SON-South Bruce siting area be selected for the Project and as more sites may become accessible for surveys through land access permits. Of the polygons selected, a total of 102 plots were in the AOI, 20 were in the LSA_{TER} outside of the AOI, and the remaining 416 were outside the LSA_{TER} but within in the LSA_{ECO}. Appendix A, the *Standard Operating Procedure for Terrestrial Ecosystem Mapping and Identification of Significant Wildlife Habitat – Southwestern Ontario Site* (TEM and SWH SOP) in the 2022 BPD Report (Zoetica 2022) depicts the location of plots planned for TEM surveys. Zoetica recommends that, in future years of study following site selection, all potentially affected plots within the AOI be surveyed, and 15 – 24% of the RSA_{ECO} be randomly surveyed at a ratio of 5:20:75 full:ground:visual plots.

3.3 Field Survey Methods

3.3.1.1 Survey Timing

TEM field work is generally conducted in July or August when vegetation is the most visible. RIC standards recommend considering local conditions when determining the optimal survey window for vegetation identification (RIC 1998). Based on these considerations, field crews conducted 2022 TEM field work between July 18 and September 29. Field crews completed as much of the field program as possible within the planned timing window.

3.3.1.2 Field Crew

Field survey crews for TEM consisted of two to four team members, with the most crews consisting of three. Field crews were required to have enough staff to cover the following roles: experienced ecosystem biologist (terrestrial vegetation specialist), experienced soil specialist, and wildlife biologist. Some modifications to this arrangement were acceptable if the skillset of the field crew covered all necessary requirements for TEM mapping and identification of Significant Wildlife Habitat (SWH; for further details see the 2022 BPD Report (Zoetica 2022)).

3.3.1.3 Field Protocol and Data Recording

Field-based TEM data collection was conducted by field staff from Tulloch Engineering Inc. (Tulloch) and their subconsultants (North South Environmental, Natural Resource Solutions Inc., SLR Consulting and Stantec) using methods outlined in the TEM and SWH SOP in the 2022 BPD Report; (Zoetica 2022). These

methods primarily followed those outlined in the *Field Manual for Describing Terrestrial Ecosystems 2nd Edition* (BC MRF and BC MOE 2010) and included details on plot size and placement, terrain classification, structural stage identification, wildlife habitat attributes, coarse woody debris, and unique features. This manual was adapted using Ontario specific guidelines. For example, for soil classification, field crews followed the *Field Guide to the Substrates of Ontario* (OMNR 2015). Field staff were provided training consisting of one classroom day to review the TEM and SWH protocols and two field days to go over methods detailed in the TEM and SWH SOP and to answer questions from the field crews. Digital form testing was also conducted during field training days. In addition to field training, five audits were conducted (two of which were in the field) by Tulloch to determine quality control of ecosite classifications determined by field staff. Bi-weekly meetings between Tulloch and Zoetica were conducted to monitor field data collection progress. A brief summary of field methods is included below, with more details found in Appendix A (TEM and SWH SOP) of the 2022 BPD Report (Zoetica 2022).

As outlined in RIC (RIC 1998), there are three survey types (full, ground, and visual) with varying levels of detail required. This system allows for highly detailed information to be collected at fewer "full" plots per ecosite and with a larger number of "ground" or "visual" plots used to confirm the desk-based ecosite classification quickly, to increase the overall accuracy of ELC maps. For vegetation surveys within full plots, field crews recorded all observed vegetation within a 400 m^2 plot, completing two transects within the plot to record coarse woody debris, and recording all trees within the plot and noting attributes for wildlife. For ground plots, field crews recorded only the dominant and indicator vegetation species. For visual plots, field crews only confirmed the ecosite code, and did not record any vegetation information. Incidental identification of SWH was completed at all survey types (see Appendix C, Chapter 1).

For soil descriptions at full plots, field crews recorded details on site topography and completed a general soil profile by auguring. At ground plots, crews recorded the site topography details, with reduced details for the soil profile (see 2022 BPD Report; (Zoetica 2022)). At visual plots, field crews only confirmed the ecosite code, and did not record any site topography or soil information.

3.4 Data Analysis

Zoetica used desk-based maps provided by SUMAC as a starting place to plan fieldwork (see Section 3.1). Data are summarized by the amount and proportion of each ecosite within each study area, and ecosite groupings are mapped to understand patterns on the landscape (see **Appendix B**). **Table 3-1** summarizes the total number of sites planned for field work after considering access and downgrading certain full and ground plots to visual plots. Vegetation attributes for ecosite classification could not always be determined because SWOOP 2020 imagery was taken in the leaf-off season and in those cases, plots were downgraded to visual. After the first season of field work in 2022, Zoetica updated desk-based maps by joining the fieldwork results with the desk-based ecosite mapping based on the polygon ID. Polygons within which fieldwork was completed were updated to the ecosite determined in the field. Data were re-summarized and mapped, with results reported in Section 4.0. Due to the differences in habitat distribution on the landscape between the portion of the LSA_{ECO} north of the AOI and the portion of the LSA_{ECO} south of the AOI (see Section 3.0, Chapter 1), further analyses focused on the LSA_{ECO} subdivided into portions north and south of the AOI. Habitat variables (e.g., soil, vegetation), habitat information (e.g., coarse woody debris, tree attributes) and forest health data are summarized and mapped where relevant.

Table 3-1. Number of planned sites for fieldwork and actual number of sites surveyed within each survey category.

Survey Type	Planned Fieldwork Locations					Actual Fieldwork Locations					Percent Completed
	AOI	LSA_{TER}	North LSA_{ECO}	South LSA_{ECO}	Total	AOI	LSA_{TER}	North LSA_{ECO}	South LSA_{ECO}	Total	
Full	5	-	32	13	*50*	1	-	28	4	*33*	66%
Ground	13	2	33	11	*59*	10	2	31	9	*52*	88%
Visual	84	18	251	76	*429*	79	18	225	67	*389*	91%
Total	*102*	*20*	*316*	*100*	*538*	*90*	*20*	*284*	*80*	*474*	88%

For the vegetation layers, Zoetica summarized the number of sites, including: the presence of each species in any layer; the number of veteran trees of each species (tree species in the A layer only); the number of sites where each species occurs as trace only; the number of sites where each species occurs as more than trace amounts; the number of sites where each species occurs within a layer or sublayer; the median percent composition of each species for sites where present; and the maximum percent composition for each species. Zoetica also calculated the number of sites including A- or B- sublayers, veteran trees, and C-, D-, and E-layers by location (in this case, the AOI and LSA_{TER} were grouped together, LSA_{ECO} north of the AOI, and LSA_{ECO} south of the AOI). Lastly, Zoetica calculated the number of sites with overall percent cover of a layer falling into bins of 0%, 1-25%, 26-50%, 51-75%, 76-99%, and 100%.

Coarse woody debris (CWD) recorded along transects and piles of CWD within each plot were summarized by site ID. For sites with reported CWD on transects, Zoetica calculated the number of pieces of CWD, number of CWD pieces with species identified, number of the pieces in each decay class, and the minimum, mean, standard error, and maximum diameter and length of pieces. For sites with reported CWD piles, Zoetica calculated the number of piles, number of piles within each category of size of interstitial spaces, and the minimum, mean, standard error, and maximum average diameter of pieces in the pile and for pile dimensions (length, width, height).

For tree attributes, Zoetica summarized data by site ID and reported the number of trees, number of trees of known species, number of trees that were standing, total number of cavities, number of trees showing evidence of wildlife use or that could be used by wildlife, and the minimum diameter at breast height (DBH) used to select trees at the site. Zoetica also calculated the minimum, mean, standard error, and maximum reported values for each site for DBH, percent of remaining bark, tree height, height to live crown, and cavities per tree. For categorical variables of crown class, crown condition, appearance rank, bark retention, wood condition, and lichen loading, Zoetica reported the number of trees at each site assigned to the different levels within a category. For each type of wildlife user and use (i.e., bird species perching, bird species feeding), Zoetica calculated the number of trees at each site.

For forest health, Zoetica counted the number of sites and calculated the proportion of sites ranked as good, fair, or poor for each location (in AOI and LSA_{TER} combined, LSA_{ECO} north of the AOI, and LSA_{ECO} south of the AOI). Zoetica determined the count and proportion of sites in each location and ranking category and reasons for the ranking (i.e., fair – 10-25% trees have severe canopy decline; poor – >25% trees have severe canopy decline).

For site disturbances, Zoetica reported the number and proportion of sites by location (AOI, LSA_{TER}, LSA_{ECO} north of the AOI, and LSA_{ECO} south of the AOI) with evidence for each disturbance type. Zoetica also

prepared an overall table including the evidence, intensity, and extent rankings for each site and disturbance type.

All calculations were performed in R (version 4.2.3). Data were formatted in Excel.

4.0 RESULTS

4.1 Ecosite Classification

Desk-based ecosite mapping prior to field verification is summarized in **Table C-1** and **Figure C-1** in **Appendix C**. Field verification commenced in June of 2022 to refine desk-based mapped ecosites based on attributes, such as soil and vegetation properties, that are difficult to interpret from aerial imagery alone. Thus, field verification was expected to refine ecosite mapping. In 2022, field crews conducted verification surveys of dominant ecosites within 474 polygons. Ecosite mapping with updates from field-verified sites is summarized in **Table C-2**. Ecosites that changed following field verification surveys are presented in **Figure C-2**, and the updated ecosite mapping is presented in **Figure C-3**. The updated mapping in **Figure C-3** only includes field-based updates, as ecosites were not updated with new desk-based information in 2023. Additional field verification is planned for the summer of 2024 to fill any data gaps identified after analyzing the data collected in 2022. Once additional field verifications and analyses of field-verified ecosite data are complete, Zoetica will include a refined ELC mapping in future iterations of the BIS Baseline Report. These updates will account for patterns in soil and vegetation attributes across the landscape observed in the field-collected data relative to desk-based mapping. Refined maps are intended to be more accurate, and may be informative for better predicting nearby polygons that have not been ground-truthed (depending on strength of patterns).

4.1.1 Comparison of Desk-based vs Field-verified Ecosites

Of the ecosite polygons surveyed during the 2022 field season (474), many (347; 73%) desk-based ecosites were reclassified or refined during field-verification (**Figure 4-1**). Of all 474 surveyed polygons, 16% changed to different habitat types (e.g., swamp, marsh, treed, thicket, meadow), 57% had less substantial changes within habitat types (e.g., Organic Hardwood Swamp to Maple Organic Hardwood Swamp) and 27% did not change. Within ecosites that were reclassified by habitat type, approximately 56% were changes from treed or marsh to swamp (52% and 4%, respectively) with smaller proportions (2 – 10%) changing to other habitat types (see **Figure C-4**). A change from treed to swamp habitat occurred primarily within and surrounding the Greenock Swamp Wetland Complex[3] (GSWC). A more detailed breakdown of ecosite changes is presented in **Table C-3**. The greatest change from treed to swamp ecosites occurred in hardwood ecosites derived from desk-based mapping. Of treed hardwood ecosites derived from desk-based mapping, 23% changed to hardwood swamp (22%) or mixedwood swamp (1%). Approximately 12% of conifer ecosites and 14% of mixedwood ecosites derived using desk-based mapping were changed to swamp ecosites. For wetland ecosites derived from desk-based mapping, the largest change to upland ecosites was 15% of field-verified marsh ecosites being reclassified as meadows. Similarly, 12% of shrub swamp ecosites and 8% of conifer swamp ecosites derived using desk-based mapping were reclassified as upland shrub and upland conifer, respectively. Smaller amounts of mixedwood swamp derived from desk-based mapping were reclassified as upland mixedwood (3%) or hardwood (2%). Ecosites were reclassified for several reasons, of which the predominant factors are discussed below (Sections 4.1.1.1 to 4.1.1.3).

[3] For delineations of the Wetland Complexes, see Figure D-2 in Chapter 3 of the 2023 BIS Baseline Report.

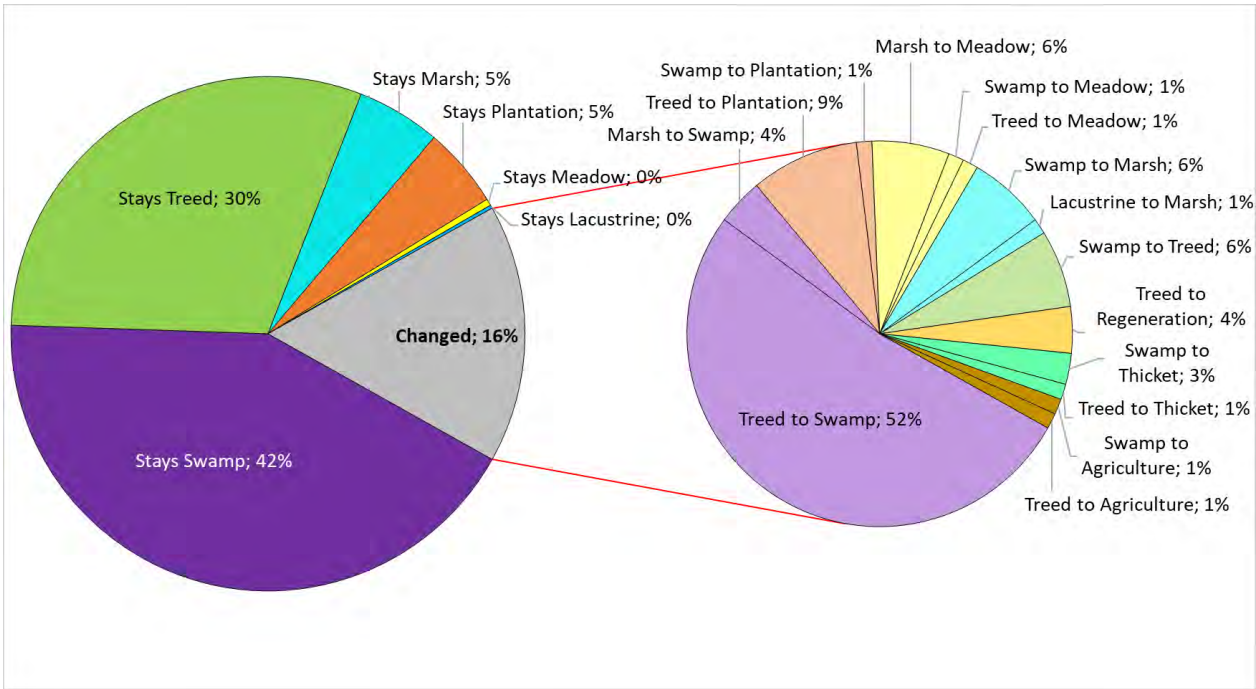

Figure 4-1. Proportions of ecosite types and ecosite type changes during TEM field studies. The pie chart on the left displays all 474 ecosites that were surveyed in 2022. The pie chart on the right displays only those 16% of ecosites that changed habitat type.

4.1.1.1 Refinement of Ecosites to Finer Categorizations

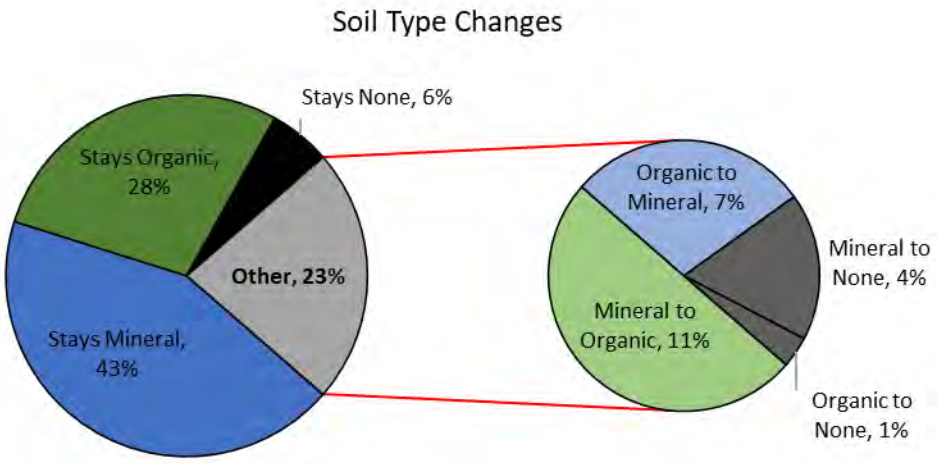
SUMAC conducted desk-based ecosite mapping using the SWOOP 2020 imagery (see Section 3.1) that was captured during early spring leaf-off conditions. Without leaves, it was often not possible to determine the dominant hardwood tree species in a polygon based on aerial imagery alone, and so many polygons were categorized into ecosites without specific vegetation information (e.g., Moist Coarse Mineral Conifer Treed). Thus, it was expected that field verification would involve refining ecosite categorizations based on tree species observed within field plots. Field crews verified ecosite ID at plots in a subsection of ecosite polygons during the leaf-on season when they were able to determine the dominant tree species in the plots and refine the ecosite accordingly. As a result, 29% of original ecosites (or 50% of changed ecosites) were refined to a finer ecosite category based on the dominant tree species in the plot. In total, 36 finer ecosite classifications (using dominant tree species) were delineated that were not possible to map during desk-based ecosite mapping using leaf-off imagery. Future field verification in the AOI and LSA_{ECO} (especially in the LSA_{ECO} south of the AOI) may result in additional ecosites that were not mapped via aerial interpretation alone. Once field verification is completed, soil and vegetation attributes will be used to update desk-based mapping of polygons that were not field-verified based on patterns of these attributes on the landscape.

4.1.1.2 Soil Properties

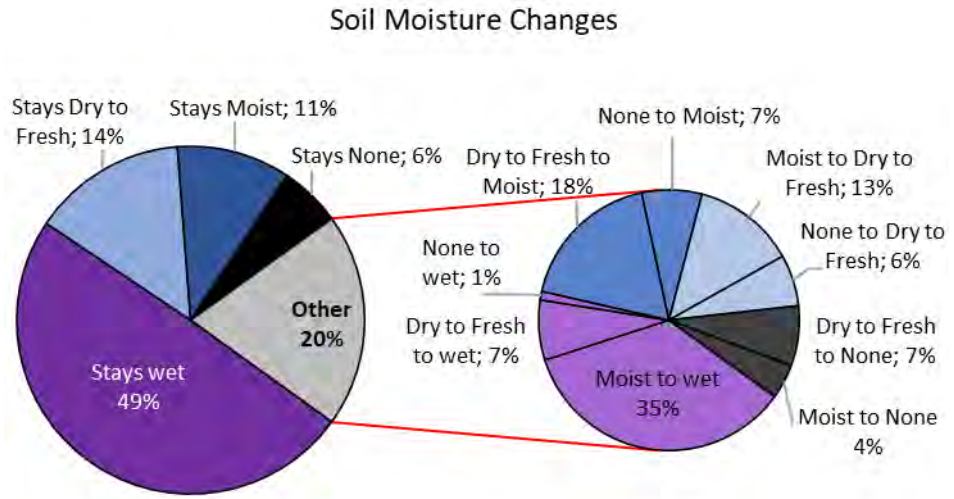
During desk-based ecosite mapping, SUMAC was not always able to determine soil conditions (soil type, texture, and moisture) from the aerial imagery used to delineate ecosite polygons. In the GLSE ecosite classification system, soil properties are one of the primary factors for defining ecosite types. Changes in

soil properties between desk-based ELC mapping and field-verified ELC classification result in larger changes in ecosite classification than in the refinement of ecosites discussed above (Section 4.1.1.1). For example, soil type and moisture can drive differences in whether an ecosite is considered an upland or wetland ecosite type, as wet mineral or organic soils often define wetlands. Approximately 23% of polygons had a change in soil type between the desk-based ELC classification and the ground-truthed classification with the most common change (50% of soil type changes) being from mineral to organic soils (**Figure 4-2**a; see Section 4.2.1.1 for further detail). Approximately 20% of polygons changed in soil moisture between desk-based and ground-truthed ELC classification (**Figure 4-2**b), with approximately 43% changing from dry or moist soils to wet soils typically found in wetlands. Approximately 24% of polygons changed in soil texture between the desk-based ELC classification and the ground-truthed classification (**Figure 4-2**c), with most changing to fine texture or no texture (note: for some wetland ecosites, e.g. those with organic soils, soil texture is not defined in the GLSE).

a)



b)



c)

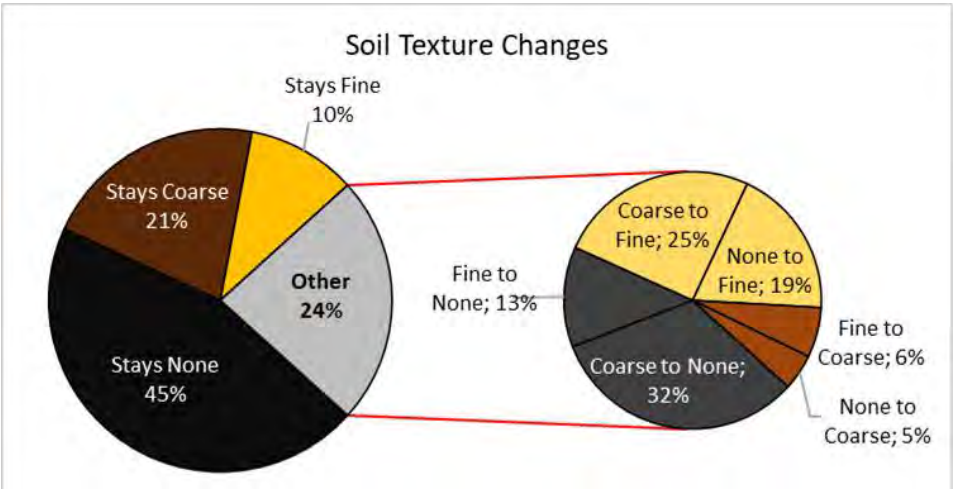


Figure 4-2. Changes in soil a) type, b) moisture, and c) texture from desk- to field-based data at surveyed plots. In each row, the pie chart on the left includes all field-assessed ecosites (*n* = 474), and the chart on the right includes only those that changed in the given soil property.

4.1.1.3 Vegetation Properties

Approximately 19% of ecosite changes (86 polygons) resulted from changes in vegetation type (conifer, hardwood, mixedwood, or none; **Figure 4-3**). Of these changes, 48% changed from mixedwood to hardwood (41 polygons) and another 2% each (2 polygons each) changed from conifer or no vegetation type to hardwood. Approximately 24% of the changes in vegetation type were from either conifer or hardwood to mixedwood (20 polygons), 12% from mixedwood to conifer (10 polygons), and 12% from hardwood or mixedwood to no vegetation type (11 polygons).

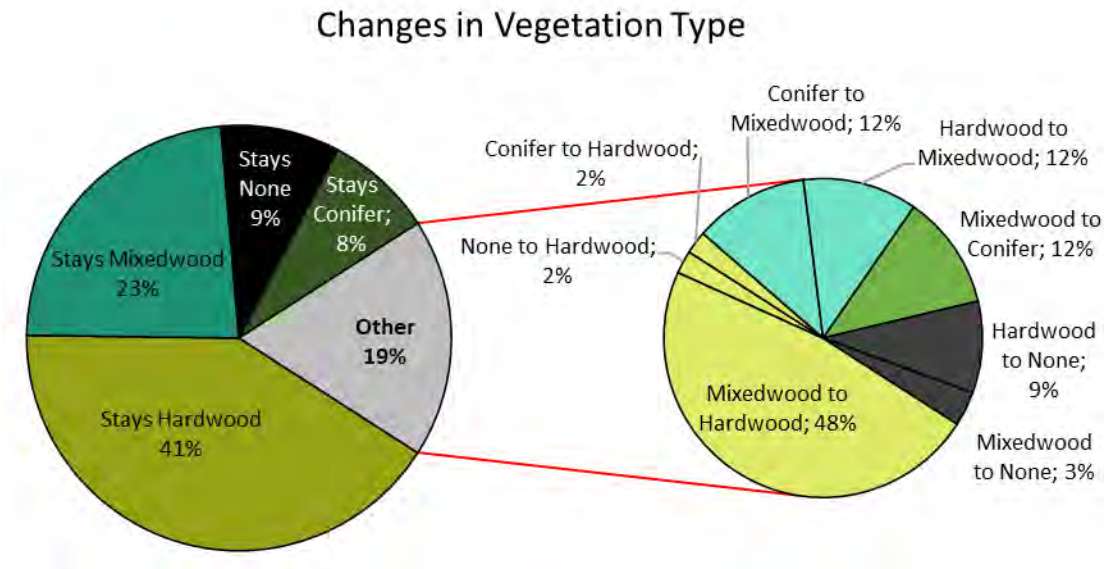

Figure 4-3. Changes in vegetation type at surveyed plots. The pie chart on the left includes all field-assessed ecosites (*n* = 474), and the chart on the right includes only those that changed vegetation type.

In addition to vegetation type changes, 59% of mapped polygons (278 polygons) changed ecosite naming due to changes in the type of vegetation or dominant tree species. Of these changes, 66% (184 polygons) were a result of refining the ecosite name by adding a tree species, with the majority (121 polygons) being maple species (e.g., sugar maple, silver maple, Freeman's maple). Five percent of changes (13 polygons) were refinements within the same genus (e.g., maple to sugar maple) and 10% of changes (27 polygons) were from an ecosite code including a species name (in desk-based mapping) to a more generic ecosite code (without species in the name). True changes among genera (e.g., white cedar to sugar maple) occurred in 11% (54 polygons) of polygons surveyed in the field. Again, in many cases tree species were not discernable during desk-based mapping due to the SWOOP imagery being collected during the leaf-off season.

Desk-based mapping was conducted only in areas within the LSA_{ECO} that were considered natural or naturalized areas. During field verification surveys, several polygons were reclassified as open agricultural areas (fields; **Table C-2**) which are not considered natural or naturalized lands but may still provide some habitat for wildlife. For example, spring flooded fields may provide stopover habitat for waterfowl and geese. Fields may also provide ecosystem services (e.g., water absorption), and so polygons reclassified as fields were included in subsequent mapping and analyses.

4.1.2 Predominant Ecosite Types

Zoetica grouped ecosites according to major categories (upland forest, wetland, plantation, shrub, meadow, field, or aquatic) and then divided them into finer groupings within these categories (e.g., wetlands grouped into conifer swamp, hardwood swamp, mixedwood swamp, shrub swamp, marsh, and fen; see **Table C-2**; **Table 4-1**; **Figure 4-4**). Ecosite groupings were mapped in the AOI, LSA_{TER}, and LSA_{ECO} (see **Figure C-3**). Distributions of these ecosite types for upland forest and wetland habitat are described in the sub-sections below and shown in **Figure C-3**, **Figure 4-5**, and **Figure 4-6**.

Within the mapped areas[4] of the AOI and LSA_{TER}, hardwood upland forests comprised the largest ecosite type covering approximately 33.2% and 34.4% of the mapped area within these study areas, respectively. Within the AOI, mixedwood upland forest ecosites were the next most dominant ecosite, followed by wetland habitat types. In the LSA_{TER}, mixedwood upland forest and hardwood swamp were the second most dominant ecosites. Within both the AOI and the LSA_{TER}, wetland ecosites comprised approximately 36% of the mapped area, both of which were 11.2 – 12.15% hardwood swamp. A similar portion of marsh habitat was mapped within the AOI (8.84%) relative to the LSA_{TER} (8.5%; **Table 4-1**; **Figure 4-4**). In addition, the LSA_{TER} contained the highest amount of fen habitat (1.1%), which was rare on the landscape (**Table 4-1**; **Figure 4-4**). There was no fen habitat within the AOI (see **Figure C-3** and **Figure 4-6**).

Within the mapped area of the LSA_{ECO}, the dominant ecosite grouping was wetlands (61.8%), with hardwood swamp comprising 39.6% of the mapped area within this study area. There was a much higher proportion of wetland ecosites in the LSA_{ECO} relative to the AOI and LSA_{TER} (**Figure 4-4**). Most of the hardwood swamps in the LSA_{ECO} were within the GSWC, north of the AOI (**Figure 4-6a** and **c**), where the landscape consists of more consolidated wetlands relative to the rest of the LSA_{ECO}. Hardwood upland forest was the next most dominant ecosite subgrouping within the $LSA_{ECO,}$ comprising 22.5% of the mapped area within this study area.

Other ecosite groupings in much smaller proportions within the natural and naturalized areas of the study areas were plantation, meadow, shrub, and polygons that accounted for watercourses and waterbodies. These ecosite groupings made up 0.1 – 4.3% of each study area with higher proportions mapped in the AOI relative to the LSA_{TER} and LSA_{ECO} (**Table 4-1**; **Figure 4-4** and **Figure C-3**). In addition, several polygons originally classified as natural or naturalized ecosites were reclassified as agricultural fields during field verification surveys.

[4] Mapped areas include natural and naturalized habitats and exclude human modified areas.

Table 4-1. Summary within the natural and naturalized areas of the AOI, LSA_{TER}, and LSA_{ECO} by ecosite grouping.

Study Area[1]	AOI			LSA_{TER}			LSA_{ECO}		
Mapped Area (ha)	643.78			1,272.25			12,696.68

Notes:
1. For the purposes of this table, the indicated study area includes overlap with other study areas that may be encompassed within its boundaries.

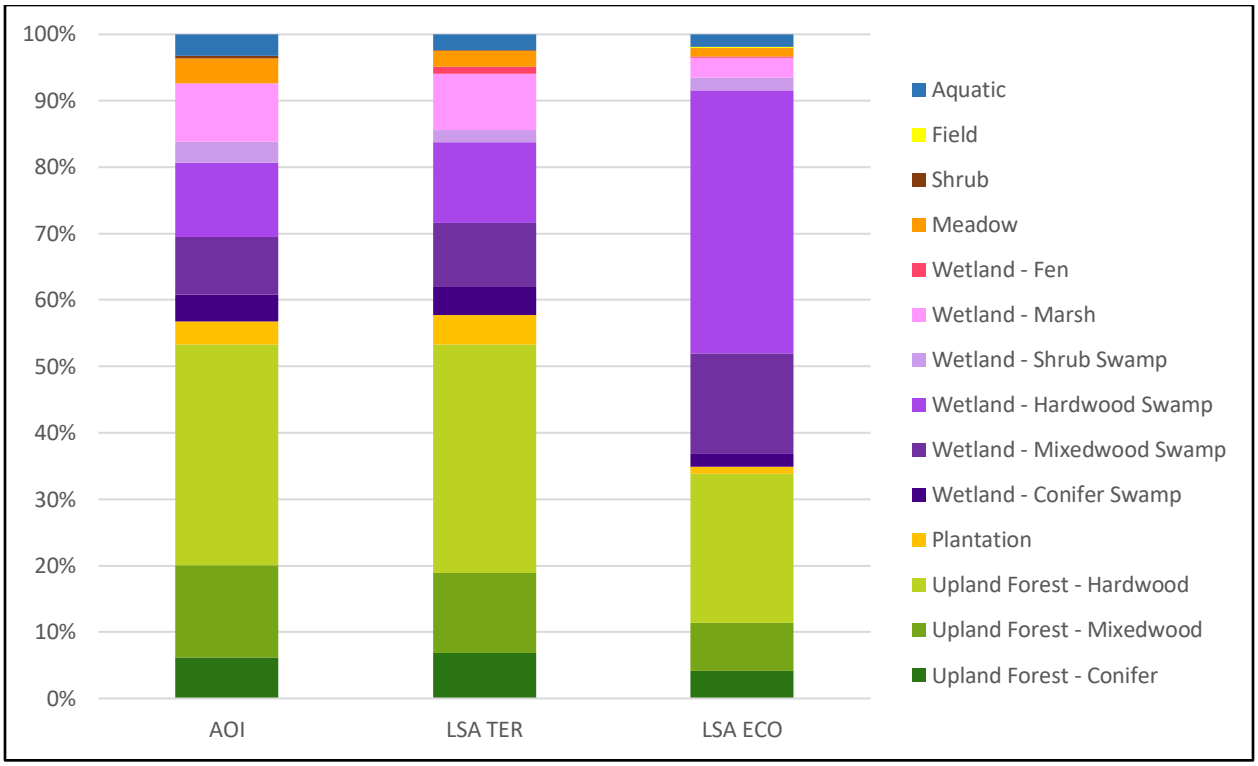

Figure 4-4. Proportions of ecosite grouping within the AOI, LSA_{TER}, and LSA_{ECO}.

4.1.2.1 Upland Forest

Hardwood Ecosites: Hardwood ecosites dominated all study areas and made up over half of upland forest in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-2**; **Figure 4-5**). Dry to Fresh Coarse Mineral Hardwood Treed (TRT-HNd1) was the dominant hardwood ecosite, constituting approximately 17-25% of upland forest in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-2**; **Figure 4-5**). Other hardwood ecosites that make up at least 1% of the total mapped area in each study area are Moist Fine Mineral Hardwood Treed (TRT-HNf11), Dry to Fresh Sugar Maple Coarse Mineral Hardwood Treed (TRT-HNd3), Moist Coarse Mineral Hardwood Treed (TRT-HNf1), Dry to Fresh Fine Mineral Hardwood Treed (TRT-HNd8), Dry to Fresh Sugar Maple Fine Mineral Hardwood Treed (TRT-HNd10), and Moist Sugar Maple Coarse Mineral Hardwood Treed (TRT-HNf8). However, proportions of these ecosites vary by study area (**Table C-2**).

Within the AOI, mapped hardwood ecosites occurred in patches throughout the study area (**Figure C-4**a). In the LSA_{TER}, outside of the AOI, hardwood ecosites were primarily located in the southern portion of the study area with small patches on the east and west sides of the study area (**Figure C-4a**). Hardwood ecosites in the LSA_{ECO} were located primarily along the eastern and western sides of the GSWC (**Figure C-4b**). In the LSA_{ECO} south of the AOI, small patches of hardwood ecosites were scattered throughout the study area (**Figure C-4c**). Hardwood ecosites in the AOI and the LSA_{ECO} south of the AOI tend to occur in horizontal bands running in a west-east direction and occur between the road allowances (**Figure C-4c**).

Mixedwood Ecosites: Mixedwood ecosites were the second-most dominant upland ecosite category, comprising approximately 20-25% of upland forest in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-2**; **Figure 4-5**). In the AOI, Dry to Fresh White Cedar Coarse Mineral Mixedwood Treed (TRT-MNd5) was the dominant

mixedwood ecosite followed by Moist White Cedar Course Mineral Mixedwood Treed (TRT-MNf3) (**Table 4-2**; **Figure 4-5**). In the LSA_{TER}, Dry to Fresh White Cedar Coarse Mineral Mixedwood Treed (TRT-MNd5) and Dry to Fresh Coarse Mineral Mixedwood Treed (TRT-MNd1) were the dominant mixedwood ecosites (**Table 4-2**; **Figure 4-5**). Moist White Cedar Coarse Mineral Mixedwood Treed (TRT-MNf3) was the dominant mixedwood ecosite in the LSA_{ECO}. Other mixedwood ecosites that make up at least 1% of the total mapped area in the AOI, LSA_{TER}, or LSA_{ECO} are Moist Coarse Mineral Mixedwood Treed (TRT-MNf1), Dry to Fresh White Pine +/Red Pine Coarse Mineral Mixedwood Treed (TRT-MNd3) and Moist Hemlock Coarse Mineral Mixedwood Treed (TRT-MNf2) constituting various proportions of upland forest within each study area (**Table C-2**).

Mixedwood ecosites were scattered in patches throughout the AOI and the LSA_{TER} (**Figure C-4a**). Within the LSA_{ECO}, mixedwood ecosites were primarily in the southern portion within the Teeswater Wetland Complex[3] (TWC) and the Wingham Wetland Complex[3] (WWC) with smaller patches located primarily on the periphery of the GSWC (**Figure C-4b** and **c**). A few small patches of mixedwood ecosites were located in the northcentral portion of the GSWC (**Figure C-4c**).

Conifer Ecosites: Conifer ecosites were the third most dominant upland ecosite category, making up approximately 10-12% of upland forest in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-2**; **Figure 4-5**). Naturalized Pine Conifer Treed Plantation (TRT-CZ1) is the dominant ecosite in the AOI, LSA_{TER}, and LSA_{ECO}. Other conifer ecosites comprising at least 1% of the total area mapped were Dry to Fresh White Cedar Coarse Mineral Conifer Treed (TRT-CNd4), and Dry to Fresh White Pine +/ Red Pine Coarse Mineral Conifer Treed (TRT-CNd3) in the AOI and LSA_{TER} (**Table 4-2**; **Figure 4-5**).

In the AOI, small patches of conifer ecosites were located primarily on the western side with smaller amounts of conifer ecosites on the north and south edges of the AOI and a small patch within the eastern central side (**Figure C-4**a). Within the LSA_{TER}, conifer ecosites were primarily located in the southern portion of the study area adjacent to the Teeswater River, with small amounts in the northern portion of the study area (**Figure C-4**a). Conifer ecosites in the LSA_{ECO} were primarily in the southern portion of the study area within the TWC and WWC with small patches on the eastern side of GSWC north of the AOI (**Figure C-4b** and **c**).

Shrub Ecosites: Shrub ecosites comprise a small proportion (< 1%) of upland ecosites within the BIS study areas. Shrub ecosites were mapped in three small polygons: one in the central AOI along the Teeswater River (**Figure C-4a**), one along Alps Creek in the LSA_{ECO} south of the AOI (**Figure C-4b**), and one south of Cunningham Lake in the LSA_{ECO} north of the AOI (**Figure C-4c**).

Meadow Ecosites: Meadow ecosites comprise a small proportion (3-7%) of upland ecosites within the BIS study areas. Meadow ecosites were scattered in small patches within the AOI and the LSA_{TER} (**Figure C-4a**), and in the LSA_{ECO}, were primarily located in small patches in the southern portion of the LSA_{ECO} and on the west side of the GSWC (**Figure C-4b** and **c**).

Plantation Ecosites: Plantation ecosites are considered anthropogenic as they are not natural or naturalized and have active and ongoing site alterations (e.g., harrowing, tending, thinning, vegetation management) to maintain ideal growing conditions for trees. Some plantations have become naturalized and are included in the conifer and mixedwood ecosite types.

Plantation ecosites comprised 3-8% of upland forest in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-2**; **Figure 4-5**). Conifer plantation (AGW-2) was the only type of plantation ecosite within the AOI. In the LSA_{TER} and LSA_{ECO}, conifer plantation was the dominant plantation type, but mixedwood plantation (AGW-3) also occurred in smaller amounts (**Table C-2**). In the AOI and LSA_{TER}, plantation ecosites were scattered in small polygons across the study area (**Figure C-4a**). In the LSA_{ECO}, there were a small number of plantation ecosite polygons along the perimeter of the GSWC in the northern portion of the LSA_{ECO} and on the western side of the southern LSA_{ECO} (**Figure C-4b** and **c**).

Table 4-2. Percent of each Upland Forest Ecosite of total Upland Forest Ecosite Types within the BIS Study Areas.

Upland Forest Grouping	Upland Forest Ecosite	AOI		LSA_{TER}		LSA_{ECO}	
		Area (ha)	% Upland Forest	Area (ha)	% Upland Forest	Area (ha)	% Upland Forest
Conifer	TRT-CZ1: Naturalized Pine Conifer Treed Plantation	21.88	6.0	39.88	5.4	288.72	6.5
Conifer	TRT-CNd4: Dry to Fresh White Cedar Coarse Mineral Conifer Treed	8.36	2.3	28.04	3.8	80.38	1.8
Conifer	TRT-CNd3: Dry to Fresh White Pine +/ Red Pine Coarse Mineral Conifer Treed	7.19	2.0	7.91	1.1	26.29	0.6
Conifer	**Other Conifer** (Ecosites <1% summed)	2.05	0.6	11.77	1.6	128.78	2.9
Mixedwood	TRT-MNf3: Moist White Cedar Coarse Mineral Mixedwood Treed	13.14	3.6	21.34	2.9	178.31	4.0
Mixedwood	TRT-MNd1: Dry to Fresh Coarse Mineral Mixedwood Treed	8.66	2.4	21.99	3.0	143.20	3.2
Mixedwood	TRT-MNf1: Moist Coarse Mineral Mixedwood Treed	10.13	2.8	14.37	2.0	113.52	2.6
Mixedwood	TRT-MNd5: Dry to Fresh White Cedar Coarse Mineral Mixedwood Treed	23.44	6.4	28.46	3.9	96.97	2.2
Mixedwood	TRT-MNd3: Dry to Fresh White Pine +/ Red Pine Coarse Mineral Mixedwood Treed	3.55	1.0	17.13	2.3	38.52	0.9
Mixedwood	TRT-MNf2: Moist Hemlock Coarse Mineral Mixedwood Treed	11.76	3.2	11.76	1.6	28.62	0.6
Mixedwood	**Other Mixedwood** (Ecosites <1% summed)	18.82	5.1	37.89	5.1	318.59	7.2

Plantation	AGW-3: Mixed Plantation	0.00	0.0	1.68	0.2	4.99	0.1

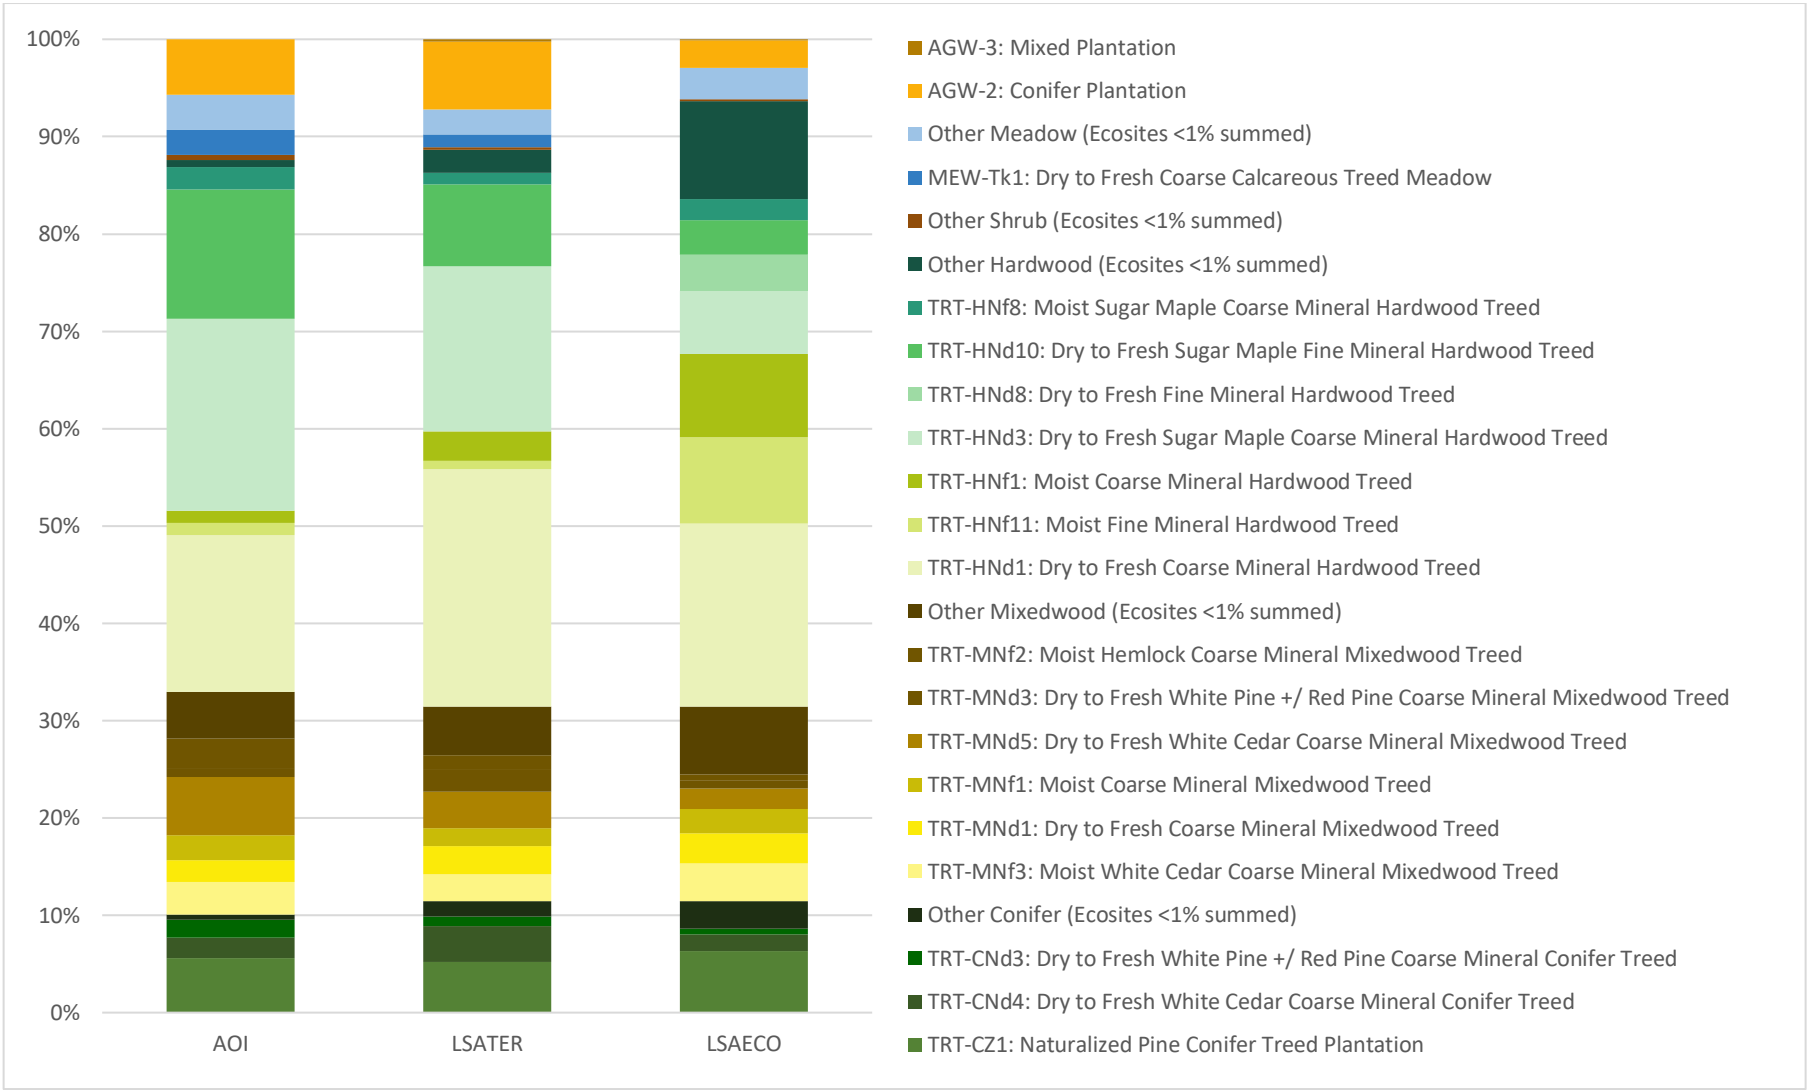

Figure 4-5. Upland forest types as percent of total upland forest within the AOI, LSA_{TER}, and LSA_{ECO}.

4.1.2.2 Wetlands

Swamp Ecosites: Swamp ecosites were prevalent in all study areas comprising over 70% of the wetland ecosites within the mapped areas of the LSA_{ECO}, LSA_{TER}, and AOI, respectively (**Table 4-1**; **Figure 4-6**).

Hardwood Swamp: Hardwood swamp ecosites were the most dominant swamp ecosite among mapped wetlands in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-3**; **Figure 4-6**). Maple Organic Hardwood Swamp (SWT-Ho2) was the dominant hardwood swamp ecosite in the AOI and LSA_{ECO}, and the second most dominant in the LSA_{TER} after Organic Hardwood Swamp (SWT-Ho3) (**Table 4-3**; **Figure 4-6**). Other hardwood swamp ecosites that make up at least 1% of the mapped area are Coarse Mineral Hardwood Swamp (SWT-Hm1), Ash Organic Hardwood Swamp (SWT-Ho1), Silver Maple +/Freeman's Maple Fine Mineral Hardwood Swamp (SWT-Hm12), Fine Mineral Hardwood Swamp (SWT-Hm8), and Ash +/ White Elm Fine Mineral Hardwood Swamp (SWT-Hm10) (**Table C-2**).

Hardwood swamp was scattered in patches throughout the AOI and LSA_{TER} (**Figure C-5**a). Within the LSA_{ECO}, larger polygons and consolidated areas of hardwood swamp ecosites were located throughout the GSWC (**Figure C-5**b). In the southern portion of the LSA_{ECO}, smaller patches of hardwood swamp ecosites were located on the western and southern sides (**Figure C-5**c).

Mixedwood Swamp: Mixedwood swamp ecosites were the second most dominant swamp ecosite category, making up approximately 25% of wetlands in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-3**; **Figure 4-6**). Mineral Mixedwood Swamp (SWT-Mm6) was the most dominant mixedwood swamp ecosite within the AOI and LSA_{TER}. Organic Mixedwood Swamp (SWT-Mo6) was the dominant mixedwood swamp ecosite in the LSA_{ECO} (**Table 4-3**; **Figure 4-6**). Other mixedwood swamp ecosites that make up at least 1% of the mapped area are White Cedar Organic Mixedwood Swamp (SWT-Mo1), Hemlock +/ Yellow Birch +/ Maple Organic Mixedwood Swamp (SWT-Mo2), White Cedar Mineral Mixedwood Swamp (SWT-Mm1), Maple Organic Mixedwood Swamp (SWT-Mo3), and Hemlock +/ Yellow Birch +/ Maple Mineral Mixedwood Swamp (SWT-Mm2) with varying proportions in the AOI, LSA_{TER}, and LSA_{ECO} (**Table C-2**).

Mixedwood swamp ecosites were scattered in small patches primarily within the northern and western portion of the AOI and LSA_{TER} (**Figure C-5a**). In the LSA_{ECO}, there were larger polygons and consolidated areas of mixedwood swamp ecosites in the central and northern portion of the GWWC (e.g., surrounding, east, and northeast of Cunningham Lake and south of Schmidt Lake; **Figure C-5b**). Smaller patches of mixedwood swamp ecosites were mapped in the southern LSA_{ECO} in the TWC and WWC (**Figure C-5c**).

Conifer Swamp: Conifer swamp ecosites made up 3-12% of wetlands in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-3**; **Figure 4-6**). When considering conifer swamp ecosites that make up at least 1% of the total area mapped, White Cedar +/Larch Organic Conifer Swamp (SWT-Co5) comprised the largest conifer swamp ecosite in the AOI, LSA_{TER}, and LSA_{ECO}. White Cedar Organic Conifer Swamp (SWT-Co1) constituted approximately 4% of wetlands within the LSA_{TER} but was present in lower amounts in the AOI or LSA_{ECO} (**Table 4-3**; **Figure 4-6**).

Conifer swamp was scattered in small patches along the Teeswater River and the tributaries of the Teeswater River within the AOI and LSA_{TER} (**Figure C-5a**). Patches of conifer swamp were also located in the northern portion of the LSA_{ECO} (e.g., in the southern end of the GSWC south of Clam Lake and north of Schmidt Lake; **Figure C-5b**). In the southern portion of the LSA_{ECO}, smaller patches of conifer swamp ecosites were located along the watercourses and tributaries of the TWC (**Figure C-5c**).

Shrub Swamp: Shrub swamp ecosites made up 3-9% of wetlands in the AOI, LSA_{TER}, and LSA_{ECO} (**Table 4-3**; **Figure 4-6**). Only one shrub swamp ecosite makes up at least 1% of the total area mapped: Organic Deciduous Thicket Swamp (SST-o1) (**Table C-2**; **Table 4-3**; **Figure 4-6**).

Within the AOI, shrub swamp was identified on the western side of the Teeswater River in the northwest portion of the AOI (**Figure C-5a**). A small patch of shrub swamp also occurs in the southern portion of the LSA_{TER} (**Figure C-5a**). Within the LSA_{ECO}, shrub swamp was primarily located along Kinlough Creek, and was also scattered in small patches in the southern and eastern portions of the GSWC (**Figure C-5b**) and south of the AOI adjacent to tributaries in the TWC and WWC (**Figure C-5c**).

Marsh Ecosites: Marsh ecosites were prevalent among wetlands in the AOI and LSA_{TER} comprising 22-25% of wetlands, but less common in the LSA_{ECO} at 5% of wetlands (**Table 4-3**; **Figure 4-6**). Organic Meadow Marsh (MAM-o1) was the dominant marsh ecosite in the AOI (**Table 4-3**; **Figure 4-6**). Mineral Meadow Marsh (MAM-m1) was the dominant marsh ecosite in the LSA_{ECO} and LSA_{TER}, and the second most dominant in the AOI (**Table C-2**).

In the AOI, marsh ecosites primarily surround the Teeswater River and in the LSA_{TER} occur in several patches isolated from main watercourses (**Figure C-5a**). In the LSA_{ECO}, marsh ecosites occur along the edges of lakes (e.g., Clam and Schmidt Lakes), in small patches along watercourses in the GSWC[3] and near the tributaries of the TWC and WWC (**Figure C-5b** and **c**). The mapping results indicate that marsh habitat may be particularly rare on the landscape, yet more prevalent within the AOI (**Figure C-5**).

Fen Ecosites: Fen ecosites were only mapped in the LSA_{TER} and LSA_{ECO} and comprised < 3% of wetlands in these areas (**Table 4-3**; **Figure 4-6**). Treed Fen (FEW-T1) was the only fen ecosite identified and was located primarily within the LSA_{TER} outside and to the north of the AOI (**Table C-2**; **Figure C-5**).

Bog Ecosites: No Bog ecosites were mapped within any of the study areas (**Table C-2**; **Table 4-3**; **Figure C-5**).

Table 4-3. Area of each wetland ecosite and percent of the total wetland ecosite types within the BIS study areas.

Wetland Grouping	Wetland Ecosite	AOI		LSA_{TER}		LSA_{ECO}	
		Area (ha)	% Wetland	Area (ha)	% Wetland	Area (ha)	% Wetland
Conifer Swamp	SWT-Co5: White Cedar +/ Larch Organic Conifer Swamp	15.02	6.5	24.59	5.2	113.60	1.4

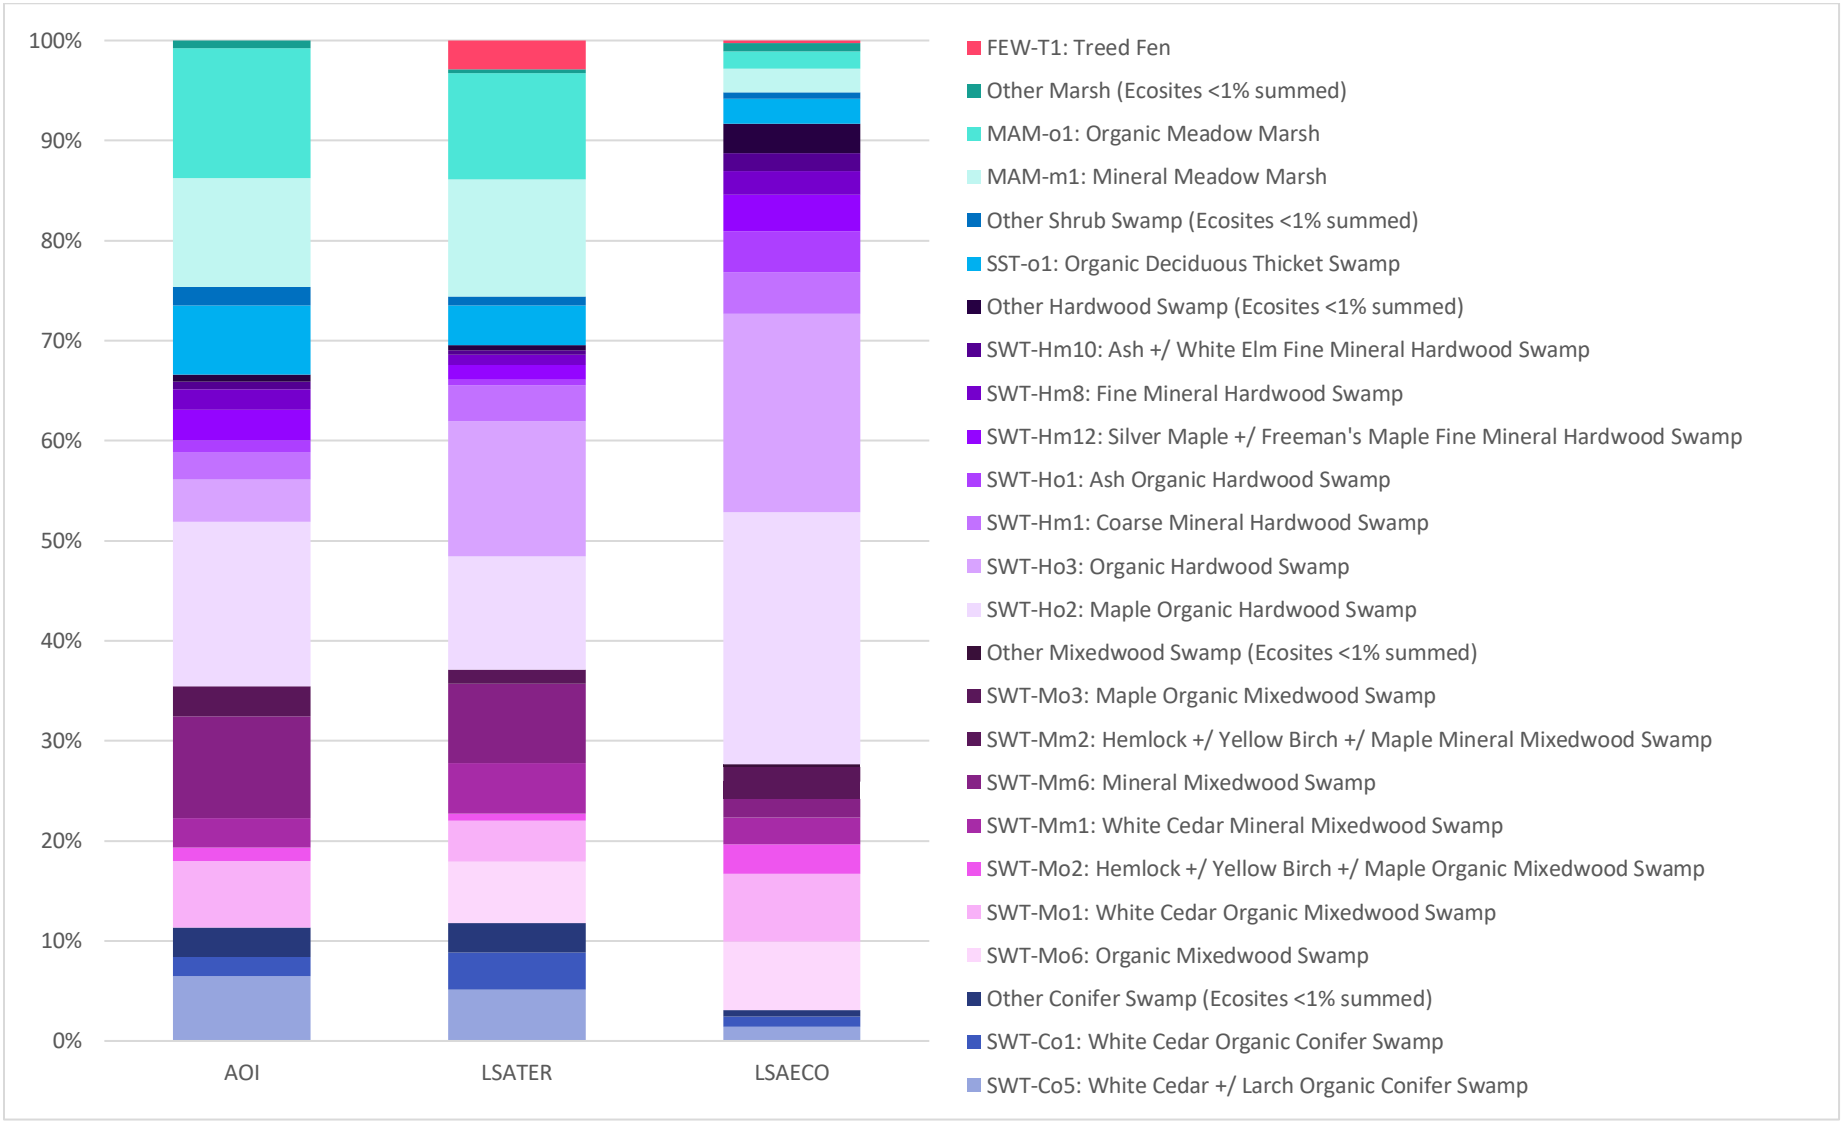

Figure 4-6. Wetland ecosite types as percentages of total mapped wetlands within the AOI, LSA_{TER}, and LSA_{ECO}.

4.1.3 Sensitive and Rare Ecosites

Several ecosites are associated with rare vegetation communities, which may be considered SWH (see Appendix C, Chapter 1) in the SON-South Bruce siting area if additional criteria are met (e.g., confirmation of ELC vegetation types or indicator vegetation species). Other ecosites can be used for initial screening of other types of candidate SWH (e.g., seasonal concentration areas, specialized habitat for wildlife, animal movement corridors) to inform future field investigations. SWH analyses are presented in Appendix C, Chapter 1 and are summarized in the Biodiversity Values (BV) sections in this 2023 BIS Baseline Report (Chapters 2-9), where applicable.

Six ecosite groupings were found to be rare on the landscape within mapped areas in the BIS study areas including shrub (ca. 8 ha; 0.06% of mapped area), wetland fen (ca. 18 ha; 0.14% of mapped area), meadow (ca. 165 ha; 1.30% of mapped area), conifer swamp (ca. 239 ha; 1.88% of mapped area), shrub swamp (ca. 245 ha; 1.93% of mapped area), and marsh (ca. 388 ha; 3.06% of mapped area). Proportions of ecosites within each of these ecosite groupings are in **Table 4-1**. A brief description of the distribution of each ecosite grouping is given in Sections 4.1.2.1 and 4.1.2.2.

Rare ecosites that are more common in the AOI and surrounding LSA_{TER} than the broader LSA_{ECO} may require consideration regarding potential Project effects, because they are rarer on the broader landscape than within the potential project siting area. Within the rare ecosite groupings, a total of 13 rare ecosites, representing <1% of the mapped area within the BIS study areas, were found in greater proportions in the AOI and/or the LSA_{TER} compared to the LSA_{ECO} (**Table 4-4**). **Figure C-6** includes the distribution of rare ecosites identified in **Table 4-4** within the BIS study areas. Of the rare ecosites in **Table 4-4**, all but one was located within the AOI. Treed fen (FEW-T1) was the sole rare ecosite that was only found outside of the AOI, treed fen was within the LSA_{TER} with a small proportion in the LSA_{ECO} north of the AOI (**Figure C-6**c). This ecosite covered approximately 0.14% of the mapped area within the BIS study areas and occurred mostly within the LSA_{TER} (**Table C-2**; **Figure C-6**). Two ecosites, Dry to Fresh Pine Coarse Mineral Mixedwood Treed (TRT-MNd4) and Dry to Fresh Fine Non-Calcareous Shrub Meadow (MEW-Sn2) were only found within the AOI and were not present in any other study areas. A single polygon of Dry to Fresh Pine Coarse Mineral Mixedwood Treed polygons occurred in the northeastern quadrant of the AOI (**Figure C-6a**). A single polygon of Dry to Fresh Fine Non-Calcareous Shrub Meadow was located in the central portion of the AOI (**Figure C-6a**). In addition, Larch Organic Conifer Swamp (SWT-Co4) and Dry to Fresh Coarse Non-Calcareous Shrub Meadow (MEW-Sn1) were primarily found within the AOI relative to other study areas (**Table 4-4**). Larch Organic Conifer Swamp (SWT-Co4) was mapped in a single polygon in the northwestern quadrant of the AOI (**Figure C-6a**) as well as in a small polygon west of Clam Lake in the LSA_{ECO} north of the AOI (**Figure C-6c**). Dry to Fresh Coarse Non-Calcareous Shrub Meadow (MEW-Sn1) was mapped in a single polygon along the Teeswater River in the northwestern quadrant of the AOI (**Figure C-6a**) as well as in a single polygon south of Schmidt Lake and west of Schmidt Creek (**Figure C-6c**). The other rare ecosites listed in **Table 4-4** range in proportion between 24.17% and 55.05% of their area being within the AOI relative to other BIS study areas (**Figure C-6a**, **b**, and **c**).

Table 4-4. Rare ecosites found within the AOI, LSA_{TER}, and LSA_{ECO}. Percent total is the percent of the study area covered by each ecosite; percent mapped is the percent of the mapped area of the study area that is covered by each ecosite; percent in each study area is the percent of the mapped ecosite that was in each study area (excluding the areas covered by nested study areas that are encompassed within its boundaries).

Study Area		AOI				LSA_{TER}				LSA_{ECO}			
Total Study Area (ha)		1,827.41				3,840.21				27,879.50

4.2 Soil and Vegetation Attributes

4.2.1 Soil Conditions

Soil texture and moisture regimes were determined by digging soil pits at full plot survey sites. Soil conditions are a primary driver in the ecosite determination, thus at ground and visual plots, soil condition is inferred from the ecosite code.

4.2.1.1 Soil Moisture Regime

Dry to Fresh Soils: Dry to Fresh moisture regime is typically affiliated with upland forest, and meadow ecosites. A greater portion of soils with dry to fresh moisture regime were located within the AOI, LSA_{TER} and southern portion of the LSA_{ECO} relative to the northern portion of the LSA_{ECO} (**Table 4-5**; **Figure D-1**). In the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI, dry to fresh soils were distributed in small patches throughout these study areas. In the LSA_{ECO} north of the AOI, dry to fresh soils were predominantly found on the outer edges of the GSWC along the eastern and northwestern side (**Figure D-1**).

Moist Soils: Moist soil moisture regime comprised a larger portion of the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI relative to the LSA_{ECO} north of the AOI (**Table 4-5**; **Figure D-1a** and **b**). Moist soils within the AOI, LSA_{TER}, and LSA_{ECO} were mapped in horizontal east to west bands along the property lines dividing properties between roadways (**Figure D-1b**). These polygons were primarily comprised of hardwood ecosites (see Section 4.1.2.1) with some mixedwood ecosites. In the LSA_{ECO}, plots with a moist soil regime were primarily located north of the AOI on the outside perimeter of the GSWC in hardwood and mixedwood ecosites, especially along the northern and northwestern portion of the LSA_{ECO} (**Figure D-1a**).

Wet Soils: Wet soils were proportionally far more prevalent in the LSA_{ECO} north of the AOI relative to the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI (**Table 4-5**). Wet soils are typically affiliated with wetland ecosite types and, within the AOI and LSA_{TER}, were predominantly found within wetter areas adjacent to the Teeswater River and its tributaries (**Figure D-1b**). Within the LSA_{ECO}, wet soils were also found within the more consolidated wetland polygons in the GSWC in the northern LSA_{ECO} (**Figure D-1a**) and the TWC and WWC in the southern LSA_{ECO} (**Figure D-1b**).

No Moisture Category: Some ecosites (e.g., plantations and agriculture) do not have defined soil attributes associated with them. Soils with no moisture information were in small polygons scattered throughout the AOI and LSA_{TER} and in polygons in the southern portion of the LSA_{ECO} south of the AOI (**Figure D-1a**). In the LSA_{ECO} north of the AOI, soils with no moisture information were in polygons scattered along the outer edge of the GSWC (**Figure D-1b**).

Table 4-5. Proportion of each soil moisture regime in mapped areas within the BIS study areas.

Moisture Regime	AOI		LSA_{TER}		North LSA_{ECO}		South LSA_{ECO}		All Study Areas Combined	
	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)
Dry to Fresh	58.0	279.6	81.0	263.0	183.0	915.2	192.0	715.3	514.0	2,173.1
Moist	23.0	60.3	29.0	55.5	308.0	1,528.1	93.0	232.2	453.0	1,876.0
Wet	96.0	231.2	120.0	245.3	633.0	6,482.5	253.0	881.8	1,102.0	7,840.7
Aquatic	5.0	21.1	7.0	8.7	21.0	206.5	6.0	8.6	39.0	245.0
None	29.0	51.6	26.0	55.9	74.0	209.7	63.0	244.6	192.0	561.9
Total	211.0	643.8	263.0	628.5	1,219.0	9,342.0	607.0	2,082.4	2,300.0	12,696.7

4.2.1.1 Soil Texture

Organic Soils: Organic soils were proportionally more prevalent in the LSA_{ECO} north of the AOI relative to the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI (**Table 4-6**). Organic soils were typically associated with marsh and swamp ecosites although some marshes and swamps had mineral soils. In the AOI and LSA_{TER}, organic soils were located primarily along the Teeswater River and tributaries (**Figure D-2a**). Similarly, in the LSA_{ECO} south of the AOI, organic soils were found along watercourses and in larger polygons in the wetland complexes[3] in the southern portion of the LSA_{ECO}. In the LSA_{ECO} north of the AOI, organic soils were predominant in the GSWC comprising large contiguous sections of the swamp (**Figure D-2b**).

Mineral Soils: Soil texture for some polygons containing mineral soils were not defined. These soils were typically found in marshes and some swamps. Small patches of mineral soils without texture definition were scattered throughout the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI (**Figure D-2a**). In the LSA_{ECO} north of the AOI, several larger patches of mineral soil without texture definition were located within the more central portions of the GSWC (**Figure D-2b**).

Fine Mineral Soils: Fine mineral soils are proportionally more prevalent in the LSA_{ECO} north of the AOI relative to the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI (**Table 4-6**). Within the AOI, fine mineral soils were in larger polygons on the northwestern side and on the eastern side. There were several smaller polygons containing fine mineral soils in the central portion of the AOI. South of the AOI in the LSA_{TER} and LSA_{ECO}, fine mineral soils were found in a few smaller polygons scattered throughout these study areas (**Figure D-2a**). In the LSA_{ECO} north of the AOI, fine mineral soils were located primarily along the outer perimeter of the GSWC (**Figure D-2b**).

Coarse Mineral Soils: Coarse mineral soils were proportionally more prevalent in the AOI, LSA_{TER} and LSA_{ECO} south of the AOI relative to the LSA_{ECO} north of the AOI (**Table 4-6**). Within the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI, coarse mineral soils were predominantly mapped in horizontal east to west bands along the property lines between roadways (**Figure D-2a**). Within the LSA_{ECO} north of the AOI, coarse mineral soils were mapped predominantly on the eastern side of the GSWC with smaller patches located along the western side of the central portions of the GSWC (**Figure D-2b**).

No Texture Category: In some polygons the ecosite was not defined as having either an organic or mineral soil type (**Table 4-6**). These polygons were typically plantations, hedgerows, and agriculture but also included thicket and fen ecosites. Many of the polygons that did not have texture information also did not have moisture information (see Section 4.2.1.1). Soils with no texture information were in small polygons scattered throughout the AOI and LSA_{TER} and in polygons in the southern portion of the LSA_{ECO} south of the AOI (**Figure D-2a**). In the LSA_{ECO} north of the AOI, polygons with soils with no texture information were scattered along the outer edge of the GSWC (**Figure D-2b**).

Table 4-6. Proportion of each soil texture regime in mapped areas within the BIS study areas.

Type and Texture	AOI		LSA_{TER}		North LSA_{ECO}		South LSA_{ECO}		All Study Areas Combined	
	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)	Count	Area (ha)
Organic	54.0	148.1	61.0	149.9	416.0	5,059.4	141.0	533.3	672.0	5,890.7
Mineral	32.0	61.6	44.0	69.4	84.0	388.2	76.0	239.9	236.0	759.1
Fine	17.0	80.2	16.0	55.6	267.0	1,776.4	14.0	59.3	314.0	1,971.4
Coarse	73.0	279.2	107.0	275.1	354.0	1,693.9	306.0	994.6	840.0	3,242.9

None	30.0	53.6	28.0	69.8	77.0	217.6	64.0	246.7	199.0	587.7

Total	211.0	643.8	263.0	628.5	1,219.0	9,342.0	607.0	2,082.4	2,300.0	12,696.7

4.2.2 Vegetation Attributes

4.2.2.1 Vegetation Structure

Structural stage (SS) represents the stage of forest succession, or the different stages a habitat goes through after disturbance. Structural stages range from the grass and forbs stage (combined as herb layer) through to mature forest. In general, greater average stand heights were correlated with higher structural stages (SS 5 – 7; **Figure D-3a**, **b**, and **c**). Plots visited within the AOI consisted primarily of lower structural stages (SS 2 – 4) on the north and west sides and higher structural stages (SS 5 – 6) on the east side. South of the AOI, structural stage was slightly higher at most surveyed plots relative to the western portion of the AOI and LSA_{TER}. Several plots with structural stages of 2 or 3 were located near waterbodies. A structural stage of 2 represents an early successional stage maintained by environmental conditions or disturbance and generally dominated by herbs. A few plots in the LSA_{ECO} north of the AOI had a structural stage of 2 and stand heights of less than 5 m, primarily on the edges of waterbodies. A structural stage of 3 represents an early successional or shrub stage with generally sparse tree cover, where tree seedlings and advance regeneration may be abundant. Structural stage and stand height in the LSA_{ECO} were greater (SS 5 or 6 and stand height of ≥ 15 m) at most plots surveyed in the GSWC north of the AOI. A structural stage of 5 represents young forest where self-thinning has become evident, and the forest canopy has started to differentiate into distinct layers. Structural stage 6 represents mature forest with mature trees that established after the last stand-replacing disturbance and established shade tolerant trees.

4.2.2.2 Vegetation Cover

Vegetation cover is the percentage of soil cover which is provided by vegetation. Vegetation cover within the AOI and LSA_{TER} was generally low relative to other areas in the LSA_{ECO} (**Table 4-7**; **Figure D-4**). Within the AOI, the greatest vegetation cover was generally found within the herb layer (75 – 100%) with lower cover values (0 – 50%) in the shrub and tree layers. A few plots on the eastern and southern side of the AOI had greater cover (51 – 99%) in the tree layers. Most sites had very low cover in the moss, lichen, and seedling layers. Across the LSA_{ECO}, vegetation cover varied substantially with greater cover in the northern portion of the LSA_{ECO} than the central and southern portions. In the northern portion of the LSA_{ECO}, the tree layer provided higher cover (50 – 99%) than other layers. However, the herb layer at many plots in the northern LSA_{ECO} also had high cover (>50%). Lower cover <50% was typically found in the shrub layer and the moss, lichen, and seedling layer north of the AOI. Vegetation cover in the different structural layers south of the AOI varied, with some sites having greater cover in the tree layer and others in the herb layer. The moss, lichen, and seedling layer was consistently low in cover percentage (<25%) throughout the study areas.

Table 4-7. Number of sites in each cover percentage class within each study area and vegetation layer.

Cover Percent	AOI and LSA_{TER}				North of the AOI				South of the AOI			
	Tree	Shrub	Herb	Moss/ Lichen	Tree	Shrub	Herb	Moss/ Lichen	Tree	Shrub	Herb	Moss/ Lichen
0	5	3	0	10	6	4	2	19	4	3	1	10
1-25	2	5	1	2	2	21	5	28	0	8	2	2
26-50	1	2	0	1	2	21	11	6	1	1	2	0
51-75	4	2	2	0	19	7	8	5	3	0	1	1
76-99	1	1	3	0	29	5	27	0	5	1	5	0
100	0	0	7	0	0	0	5	0	0	0	2	0

4.2.2.1 Dominant Vegetation

Dominant vegetation and species of interest were recorded in the tree (A), shrub (B), herb (C), moss, lichen, and seedling (D), and epiphyte (E) layers at ground plots and full vegetation profiles were recorded for these layers in full plots during TEM surveys. **Appendix D** summarizes all vegetation recorded during TEM surveys in each layer by study area. **Table D-1** summarizes all plots by vegetation layer type and **Table D-2** summarize all plots by vegetation species.

4.2.2.1.1 Tree Layer (A Layer)

The most reported tree species include red maple, green ash, white elm, yellow birch, black ash, eastern white cedar, sugar maple, and balsam fir (see **Table D-2**). However, species differed by study area. In the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI, the most reported tree species were eastern white cedar and white elm, though white elm was reported in trace quantities (<5%) in three of the four plots where it was detected (see **Table D-2**).

The tree layer is divided into sublayers 1-3, and the species making up the sub-layers differed by study area (see **Table D-2**). In the AOI and LSA_{TER}, only four plots had trees within the A1 layer, which are the dominant (tallest) trees of the main canopy usually constituting a minor portion of overall stand composition (see **Table D-1**). In the AOI and LSA_{TER}, A1 sublayer trees were silver maple and basswood. Only one plot in the in AOI and LSA_{TER} study area had veteran trees in the A1 layer; this plot also contained the basswood stand. A2 layer trees are the main canopy whose crowns comprise the upper layer of foliage and typically constitute the major portion of the stand composition. A variety of species comprised the A2 layer in the AOI and LSA_{TER}, but the most reported trees were eastern white cedar and yellow birch (three plots each; see **Table D-2**).

South of the AOI in the LSA_{ECO}, the A1 layer had nine species detected in eight plots, of which five species had veteran trees across four plots (sugar maple, eastern white pine, eastern cottonwood, trembling aspen, and eastern hemlock). Ten tree species were recorded in the main (A2) canopy layer across 10 plots, and eight tree species were recorded in the A3 layer across 11 plots. See **Table D-1** and **Table D-2** in **Appendix D.**

In the LSA_{ECO} north of the AOI, 10 tree species were recorded in the A1 layer across a total of 33 plots. In addition, 10 species of veteran trees were recorded, of which four species (American beech, tamarack, black cherry and white elm) were not recorded in the A1 layer. Twenty tree species were recorded in the

main (A2) canopy layer across 54 plots, and 22 species were recorded in the A3 layer across 50 plots. See **Table D-1** and **Table D-2** in **Appendix D**.

4.2.2.1.2 Shrub Layer (B Layer)

The shrub layer includes all woody plants less than 10 m tall, except low (usually <15 cm tall) woody or trailing plants which are part of the herb layer. Established tree regeneration more than two years of age and less than 10 m in height is considered part of the shrub layer. There are two sublayers within the shrub vegetation category: tall shrub (B1) which includes all woody plants 2 – 10 m tall, including shrubs, advanced tree regeneration, and trees in poorly growing stands where the canopy is less than 10 m tall, and low shrub (B2) which includes all woody plants less than 2 m high, except low (<15 cm) woody or trailing plants, shrubs and established tree regeneration more than two years old, and dwarfed or immature specimens of species normally considered in the tall shrub category. The most detected shrub species varied by study location (see **Table D-3** in **Appendix D**). In the AOI and LSA_{TER}, eastern white cedar, green ash, black ash, red-osier dogwood, common elderberry, and nannyberry were most common within plots. In plots within the LSA_{ECO} south of the AOI, white elm, sugar maple and eastern white cedar were most reported. In plots within the LSA_{ECO} north of the AOI, green ash, white elm, red maple, yellow birch, black ash, and northern spicebush were most common. The total number of species recorded in the shrub layers within each study area increased moving northward. At plots within the LSA_{ECO} south of the AOI, four species were recorded in the B1 layer across 11 plots and five species were recorded in the B2 layer across 10 plots. At plots within the AOI and LSA_{TER}, nine species were recorded in the B1 layer across nine plots and 12 species were recorded in the B2 layer across 11 plots. In the LSA_{ECO} north of the AOI, 28 species were recorded in the B1 layer across 54 plots and 43 species were recorded in the B2 layer across 55 plots.

4.2.2.1.3 Herb Layer (C Layer)

The herb layer includes all herbaceous species, regardless of height, and some low woody plants less than 15 cm tall. The herb layer in all study areas had the greatest number of species relative to other vegetation layers. A summary of all herb species detected within each study area and the number of plots where they were found are provided in **Table D-1** and **Table D-4** in **Appendix D**. A total of 139 species were detected across 13 plots in the AOI and LSA_{TER}, 101 species were detected across 13 plots in the LSA_{ECO} south of the AOI, and 278 species were detected across 57 plots in the LSA_{ECO} north of the AOI. Many of the herb species were detected in trace amounts (<5%) within plots surveyed.

4.2.2.1.4 Moss, Lichen, and Seedling Layer (D Layer)

The moss, lichen, and seedling layer includes all bryophytes, terrestrial lichens, and liverworts, and tree seedlings less than two years old that occur on mineral soil and humus. A summary of all D layer species is provided in **Table D-5** in **Appendix D**. A total of 14 species were detected across seven plots in the AOI and LSA_{TER}, 13 species were detected across five plots in the LSA_{ECO} south of the AOI, and 43 species were detected across 46 plots in the LSA_{ECO} north of the AOI. Similar to the herb layer, many of the species detected in the moss, lichen, and seedling layer were in trace amounts within the plots surveyed.

4.2.2.1.5 Epiphyte Layer (E Layer)

The epiphyte layer includes all species which grow on other living plants. The epiphyte layer had the fewest species recorded across plots relative to the other vegetation layers. A summary of all E layer species is provided in **Table D-6** in **Appendix D**. Species differed in each study area. A total of two species

were recorded in the AOI and LSA_{TER}: Virginia creeper and riverbank grape. In the LSA_{ECO} south of the AOI, only unknown mosses were recorded. In the LSA_{ECO} north of the AOI, several species of moss, lichens, creepers, and grapevines were recorded.

4.2.2.2 Invasive Species

During TEM field surveys, the abundance, extent, and distribution of invasive plant species (see Table A-3 in Chapter 2) were recorded as part of the vegetation survey. Chapter 2 (Vegetation) of this 2023 BIS Baseline Report discusses invasive plant species in more detail, including the various species detected during field surveys. This section summarizes the overall distribution, abundance, and extent of invasive species within the plots surveyed.

Within the AOI, invasive species were noted to be dominant, extensive, and uniform in a plot located within the northern portion of the AOI (**Figure D-5**a). This plot was the only full survey plot within the AOI. An additional plot in the southern portion of the AOI along the Teeswater River had invasive species considered widespread and occasional with uniform distribution. A second plot along the Teeswater River towards the north of the AOI had invasive species that were considered widespread and occasional with scattered distribution (**Figure D-5**a). In the east side of the LSA_{TER}, one additional plot had invasives which were considered widespread and occasional with scattered distribution (**Figure D-5**a). At all other plots in the AOI and LSA_{TER} with invasive species, they were considered rare in abundance but local or widespread in extent.

Within the LSA_{ECO}, invasive species were considered extensive and dominant in the northern area of Schmidt Lake (**Figure D-5**b). This area is frequented by visitors. There were additional plots with invasives considered extensive or widespread and abundant on the eastern side of the LSA_{ECO}, and in the central areas of the GSWC north of the AOI. Invasive species in the LSA_{ECO} south of the AOI were predominantly considered rare or not present with only a few considered widespread and occasional in patchy or uniform distribution along the southern portion of the LSA_{ECO} near lakes (**Figure D-5**c).

4.2.3 Habitat Features for Wildlife

The sections below summarize results of vegetation that can support various habitats for wildlife. As there were not enough accessible polygons within each ecosite category in 2022 to fulfill the TEM design (see Section 3.2), summaries of habitat features could not be reported by ecosite type and are instead reported by survey location.

4.2.3.1 Coarse Woody Debris

Coarse woody debris (CWD) can provide habitat for wildlife and provides an essential nutrient source for regrowth of vegetation. Coarse woody debris was recorded along transect surveys conducted at full plots within the AOI, LSA_{TER}, and LSA_{ECO}. A summary of CWD recorded within each plot surveyed is provided in **Table D-7** in Section D.3. CWD encountered during transect surveys was ranked by decay class according to decay classes outlined in RIC (RIC 1998) and in Figure 3-3 in the TEM and SWH SOP (Appendix A in the 2022 BPD Report; Zoetica 2022). Decay classes ranged from class 1 being least decayed to class 5 being most decayed. Decay classes of CWD encountered were fairly evenly distributed with slightly fewer recorded in decay class 5 (latest stage of decay).

Field crews recorded the presence of any piles of CWD within the plots. Piles of CWD can by used by wildlife to provide shelter from the elements and predators or to carry out a particular life history stage

(e.g., rearing young/denning). Twenty-two piles of CWD were recorded during surveys (**Table 4-8**). A summary of CWD piles recorded within each plot surveyed is provided in **Table D-8** in Section D.3. The average size of the interstitial spaces in each pile were split almost equally between small (the size of or smaller than a squirrel) and medium (the size of a coyote) (**Table 4-9**). Only one pile of CWD recorded during surveys had large interstitial spaces that are the size of, or larger than, the average black bear.

Table 4-8. The number of pieces of coarse woody debris by decay class encountered during transect surveys within each full plot.

Site ID	*N*	# Coarse Woody Debris per Decay Class

TEM_033	Plantation	1	1	0	0
	Total	22	10	11	1

Wildlife users of CWD were recorded during full plot surveys when evidence of wildlife was present. A total of 10 plots had documented wildlife use of CWD with a variety of wildlife user types recorded (**Table 4-10**). Most wildlife users were birds, followed by insects. None of the species recorded were at-risk. Two plots had multiple recorded cases of wildlife use of CWD; one plot (TEM_013) had three recorded cases and one plot (TEM_029) had two cases. Plot TEM_013 is located on the western side of Schmidt Lake in the LSA_{ECO} north of the AOI and plot TEM_029 is in the southern tip of the LSA_{ECO} south of the AOI (see **Figure B-1** for locations of plots).

Table 4-10. Wildlife users of coarse woody debris encountered during TEM full plot surveys.

Site ID	CWD Species (if known)	Wildlife User	Wildlife User Species	Evidence of Wildlife use
TEM_013	Green ash / red ash	Bird	Woodpecker spp.	Woodpecker holes
TEM_013	Unknown	Snake	Eastern Gartersnake	Eastern gartersnake went under log
TEM_013	Yellow birch / swamp birch	Bird	Bird spp.	Bird feces on log; possible perch site
TEM_015	Black ash	Insect	Emerald Ash Borer	EAB evidence
TEM_017	White spruce	Insect	Insect spp.	Insect boring
TEM_022	Unknown Deciduous/Hardwood	Insect	Insect spp.	Insect boring
TEM_024	Maple spp.	Bird	Woodpecker spp.	Woodpecker holes
TEM_025	Unknown Deciduous/Hardwood	Salamander	Salamander spp.	Salamander inside
TEM_029	Eastern white pine	Bird	Woodpecker spp.	Woodpecker holes
TEM_029	Eastern white pine	Bird, Insect	Woodpecker spp., Insect spp.	Woodpecker holes; insect boring
TEM_030	Eastern cottonwood	Bird	Woodpecker spp.	Woodpecker holes
TEM_032	Unknown	Salamander	Salamander spp.	Juvenile salamander (either red-backed or blue-spotted, too young to show markings) inside log
TEM_033	Unknown Coniferous/Softwood	Bird	Pileated Woodpecker	None. Pileated woodpecker cavities present (assumed from when it was standing)

4.2.3.2 Tree Attributes

A total of 33 full plots were assessed for tree attributes during TEM field surveys. Except for hardwood swamp ecosite groupings, not enough plots in the other ecosite types were surveyed to relate data to habitat groupings. **Table D-9** in Appendix D summarizes the attributes of trees assessed within each full plot visited. Trees within full plots were also assessed for various condition attributes. **Table 4-11** summarizes the ratings for selected trees assessed within each full plot. Many of the trees assessed within each site were deemed to be healthy and in good condition (i.e., having lower rating codes in each category). All trees assessed within the only plot surveyed in the AOI were conifer trees in good condition with low ratings for all categories. However, most sites in the LSA_{ECO} contained several trees with varying condition ratings. In general, while most trees were in good condition, deciduous trees had more of a range in appearance codes than conifer trees. Bark retention in trees at most plots was good (class 1 or 2), however 10 plots had some trees with >25% bark lost (classes 4-7). Crown class was most often co-dominant followed by dominant, and crown condition was considered primarily good (class 1 or 2); however, 20 plots had trees with no foliage present in the crown and with various stages of decay (classes 3-6). Lichen load was low in trees in most plots, however, nine plots had trees with more than ten 5 g clumps of lichen (classes 3-5). These trees were mostly located in the LSA_{ECO} north of the AOI. Most plots had trees with good wood condition, however, five plots had trees with decay spreading (class), and five plots had trees with at least some spongy sections of wood (classes 5-7).

Table 4-11. Tree attributes of the largest trees within each full plot surveyed. Cells are highlighted according to the proportion of trees surveyed that fell into each category (darker greens correspond to larger proportions).

Site ID	Study Area	Habitat Type	N	Appearance Conifer					Appearance Deciduous							Bark Retention							Crown Class					Crown Condition						Lichen Load						Wood Condition

Notes:

Appearance Conifer/Deciduous: is a rank of overall condition of the tree with the following codes: 1 = Live and healthy; 2 = Live and unhealthy, internal decay or growth deformity, broken tops, dying tree; 3 = Dead and needles and fine twigs present; 4 = dead and no needles or fine twigs only coarse limbs; 5 = Dead and most branches or bark absent; 6 = Dead and no branches or bark; 7 = Dead and extensive internal decay and half original height; 8 = Dead and extensive internal decay and 1/3 original height; 9 = Dead and downed tree or stump

Bark Retention: 1 = All bark present; 2 = Bark lost (<5%) on damaged areas only; 3 = Most bark present (5 - 25% lost), bare patches, some bark may be loose; 4 = Bare sections (26-50% lost), firm and loose bark remains; 5 = Most bark gone (51-75%), firm and loose bark remains; 6 = Trace bark remains (76-99% lost); 7 = No bark (100% lost)

Crown Class: D = Dominant trees with crown extending above the general level of the layer, well developed crowns; C = Codominant trees with crowns forming the general level of the crown canopy; I = Intermediate trees with crowns below but extending into the general level of the crown canopy and small crowns; S = Suppressed trees with crowns entirely below the general level of the crown canopy

Crown Condition: 1 = All foliage, twigs, and branches present; 2 = Some or all foliage lost, possibly some twigs lost, all branches usually present, possibly broken at the top; 3 = No foliage present, up to 50% twigs lost, most branches present, possible broken top; 4 = No foliage or twigs present, up to 50% branches lost, top usually broken; 5 = Most branches have gone, some sound branch stubs remain, top broken; 6 = No branches present, some sound and rotting branch stubs, top broken.

Lichen Load: Quantity of lichen in 5g clumps: 0 = 0; 1 = 1; 2 = 2-10; 3 = 11-50; 4 = 51-125; 5 = >125

Wood Condition: 1 = No decay; 2 = Probably limited internal decay and/or deformities; 3 = Wood essentially hard, limited decay; 4 = Wood mostly hard, but decay spreading, softwood present; 5 = Balance of hard and softwood, spongy sections; 6 = More soft and spongy wood than hardwood; 7 = No more hardwood, all soft or spongy, powdery sections; 8 = Hollow shell, outer wood mostly hard or firm.

Table 4-12 presents a summary of full plots surveyed with trees where wildlife use was recorded. The majority of wildlife user sign was from birds. However, 12 plots recorded bat species use and one plot recorded white-tailed deer use. The species of bat were not recorded, and thus it is not clear whether any bats were at-risk species; however, several at-risk bat species have been documented within the BIS study areas (see Section 6.0 of Chapter 4). Most of the wildlife activity recorded was perching or roosting by birds and bats followed by feeding by woodpecker and sapsucker species. Two plots (TEM_008 and TEM_031) contained trees used for open nests and two plots (TEM_016 and TEM_032) contained trees used for cavity nesting. One plot (TEM_024) southwest of Schmidt Lake in the LSA_{ECO} north of the AOI contained a tree used for denning, but the wildlife species was unknown, and one plot (TEM_029) in the LSA_{ECO} south of the AOI contained a tree that was marked by white-tailed deer (see **Figure B-1** for plot locations).

Table 4-12. Full survey plots with larger trees with recorded wildlife use during TEM surveys. See Figure B-1 for location of sites.

Notes:
Wildlife Activity Codes: P = perching/roosting; F = feeding; O = open nest; C= cavity nest; D = denning/resting; T = travel; M = mark tree
For all standing trees with an effective crown, it was assumed that perching activity by bird species occurs.
For all large trees (>25 DBH) with an appearance code of 4 or less (see **Table 4-11**) with notes indicating recorded cavities, Bat spp. were assumed as the wildlife user.
For trees with field notes indicating a crevice in the roots, denning was assumed by an unknown mammal.
For trees with notes indicating a potential cavity nest, wildlife user was assumed to be an unknown bird.
Data in the table does not capture deer browsing or use of the surveyed plot by species that do not use the larger trees. Deer browsing is captured in the forest health assessment in Section 4.3.

4.3 Forest Health

Overall forest health was rated at full plots during field surveys. Forest health was rated as poor, fair, or good based on three variables: tree health, standing snags, and deer browse. In general, forest health at most plots was considered fair to poor throughout the LSA_{ECO} (**Figure E-1**; **Table 4-13**).

In most plots, tree health was rated fair. However, at the full plot in the northern portion of the AOI tree health was rated good. Tree health was also rated good at several plots in the northeastern LSA_{ECO} and at two plots in the southern LSA_{ECO} (**Figure E-1**). Ratings of fair and poor were due to several factors including evidence of emerald ash borer (EAB), evidence of beech bark disease (BBD), fungus or cankers, and severe canopy decline (**Table 4-13**).

Of the sites rated as 'fair' for tree health, all sites had signs of EAB detected in the stand with the ash component ≤30%. EAB was detected in 75% of sites rated poor, with 25% in stands constituting ≤30% ash and 50% in stands constituting >30% ash (**Table 4-14**). **Figure E-2** presents full plot sites which contain ash species and those with detected EAB. EAB was detected only at full plot sites in the LSA_{ECO} north of the AOI. Only three of the 25 sites north of the AOI containing ash species did not have evidence of EAB. Two full survey sites in the LSA_{ECO} south of the AOI contained ash species but did not have evidence of EAB. No ash species were detected in the full plot surveyed in the AOI. EAB was also recorded incidentally during other BIS field surveys, and a full overview of its detection is presented in Chapter 9.

The other factors contributing to a tree health rating of poor or fair were not as prevalent as EAB. BBD was only detected at one site in the LSA_{ECO} south of the AOI rated as poor tree health and the pathogen *Neonectria* was present at this site (**Figure E-2**). Two full survey sites in the LSA_{ECO} north of the AOI also had beech trees but did not have evidence of BBD. Fungus or cankers were present at eight sites (six rated fair and two rated poor). Severe canopy decline was detected at seven sites (six rated fair affecting 10-25% of trees and one rated poor affecting >25% of trees).

Table 4-13. Number of full survey sites in each study area ranked by forest health category.

Forest Health Attribute	Tree Health			Standing Snags			Deer Browse		
	Good	Fair	Poor	Good	Fair	Poor	Good	Fair	Poor
AOI (1)	1	-	-	-	-	1	-	-	1
LSA_{ECO} North (28)	5	20	3	4	12	12	2	7	19
LSA_{ECO} South (4)	2	1	1	1	1	2	-	-	4
Total (33)	8	21	4	5	13	15	2	7	24
Notes: Number in brackets is the total number of full plots assessed in each study areas.									

Table 4-14. Factors affecting condition of tree health in full plots surveyed for tree condition.

Condition	# Sites	Emerald Ash Borer detected in stand		Beech Bark Disease detected in stand		Fungus, Cankers		Severe Canopy Decline	
		≤30% ash	>30% ash	Pimples present	*Neonectria* present	5-10% trees	>10% trees	10-25% trees	>25% trees
Fair	21	21 (100%)	-	-	-	6 (29%)	-	6 (29%)	-
Poor	4	1 (25%)	2 (50%)	-	1 (25%)	1 (25%)	1 (25%)	-	1 (25%)

Standing snags are an indicator of healthy ecosystems because they can provide animals with shelter for nesting, and food (Hutto 2006). Of the 33 plots rated for forest health during TEM surveys, only 15% of plots (four plots in the LSA_{ECO} north of the AOI, and one in the LSA_{ECO} south of the AOI) were rated as "good" for standing snags (**Table 4-13**). Many (45%) plots surveyed for forest health were rated as poor for standing snags as they had less than 11% standing tree snags and less than eight snags per ha with DBH of greater than 25 cm (**Table 4-13**). Another 39% of plots were rated as fair as they had either less than 11% standing tree snags or less than eight snags per ha with DBH greater than 25 cm (**Table 4-13**). The plot surveyed in the AOI was rated as poor quality for standing snags.

Deer browsing can impact the quality of forest for other animals (Rooney and Waller 2003). Over-browsing can significantly reduce the understory cover which in turn can impact growth of new trees and the overall structure of the forest (Laurent et al. 2017). Most (73%) plots surveyed for forest health were rated as "poor" quality due to deer browsing as they had less than 225 tree seedlings per 400 m^2 (**Table 4-13**), including the plot located in the AOI and all plots surveyed in the LSA_{ECO} south of the AOI. Only two plots (6%) located in the LSA_{ECO} north of the AOI were deemed high quality and had ≥225 tree seedlings per 400 m^2 and a seedling ratio[5] of ≥0.

4.3.1 Disturbance

4.3.1.1 Logging Disturbance

Disturbance due to past logging activities was assessed as part of the overall condition of the plots. A full summary of logging damage by plot (where logging was present) is provided in **Figure E-1** in **Appendix E**. Disturbance due to logging in each study area was primarily due to past logging >30 years ago with less logging disturbance reported within each subsequent timeframe assessed (see **Table E-1** and **Figure E-3** [Maps 1 – 5]). The AOI had the highest proportion of plots with recent logging activity within the past five years (**Table 4-15**; **Figure E-3**). Recent logging activity occurred in plots scattered primarily within the northern, western, and central portions of the AOI. Intensity and extent of logging occurring within the last 15 years within the AOI was low to medium. Intensity and extent of logging was greatest in the northern portion of the AOI but primarily occurred > 30 years ago. With the exception of logging activity within the past 5 years, the LSA_{TER} and LSA_{ECO} south of the AOI were most similar to the AOI when considering logging disturbance proportions by timeframe (see **Figure E-3** [Map 1 – 5]). Plots within the LSA_{ECO} north of the AOI had the lowest proportion of plots with logging within the last 30 years (**Table 4-15**). The GSWC comprises much of the area within the LSA_{ECO} north of the AOI and is a Provincially Significant Wetland which is protected from extensive logging.

Table 4-15. Proportion of plots surveyed in each study area with logging at various time frames.

Study Area	Number of Plots	Logging: 0-5 years	Logging: 5-15 years	Logging: 15-30 years	Logging: 30+ years
AOI	90	19%	7%	11%	43%
LSA_{TER}	20	0%	10%	15%	65%
LSA_{ECO} N	283	1%	2%	5%	54%
LSA_{ECO} S	80	9%	11%	10%	56%
Notes: Field crews used clues that were visible on site to determine age of logging (e.g., apparent age of regenerating cohort, degree of stump decay, apparent freshness of logging disturbance such as skid trails).					

[5] Ratio of tall (≥ 30 cm) to short (< 30 cm) seedlings; method for assessing impact of ungulate browsing.

Damage to the remaining trees within the plot due to previous logging activities was also recorded during the assessment of the overall plot condition. The greatest damage to the trees remaining in plots where previous logging activities occurred were related to broken branches, broken stems, and leaning trees (**Table 4-16**). Uprooted trees, stem woods, root damage, tire ruts, and excessive skid trails were also recorded at some plots (**Table 4-16**). No evidence of girdled trees was present at any plots surveyed within any study area. The proportion of plots with various tree damage related to logging was highest in the AOI followed by the LSA_{TER} and LSA_{ECO} south of the AOI (**Table 4-16**).

Table 4-16. Proportion of plots surveyed in each study area with damage to trees from logging activities.

Study Area	*N* Plots	Stem Broken	Uprooted Trees	Girdled Trees	Stem Wounds	Broken Branches	Leaning Tree	Root Damage	Tire Ruts	Excessive Skid Trails	Excessive Skid Trail Width
AOI	90	13%	7%	0%	9%	14%	12%	8%	4%	6%	3%
LSA_{TER}	20	5%	0%	0%	0%	0%	0%	0%	5%	5%	0%
LSA_{ECO} N	283	1%	1%	0%	1%	2%	2%	1%	2%	1%	1%
LSA_{ECO} S	80	4%	4%	0%	4%	5%	8%	4%	0%	1%	1%

4.3.1.1 Human Disturbance

Human disturbance from several activities was assessed as part of the overall condition of the plots. A full summary of human disturbance activities by plot (where disturbance was apparent) is provided in **Table E-3** in **Appendix E**. **Table 4-17** provides the proportion of plots within each study area with various human disturbance activities. In the AOI, the highest proportion of human disturbance was related to tracks and trails followed by gaps in the canopy. Recreational use, planting (tree plantations), and earth displacement was present in >10% of plots surveyed in the AOI. Livestock grazing, dumping, and sugar bush operations were also recorded in a smaller proportion of plots in the AOI. Tracks and trails represented the highest proportion of human disturbance in the LSA_{TER} and LSA_{ECO} south of the AOI. Livestock grazing was prevalent in the highest proportion of plots within the LSA_{TER}. Recreational use was documented in the highest proportion of plots in the LSA_{ECO} south of the AOI. Gaps in the canopy, tree plantation planting, and dumping were also present in >10% of plots surveyed in the LSA_{ECO} south of the AOI. In the LSA_{ECO} north of the AOI, the most common human disturbance activity was gaps in the canopy followed by trails and tracks and recreational use.

Table 4-17. Proportion of plots surveyed in each study area with human disturbance activities.

Study Area	*N* Plots	Sugar Bush Operations	Gaps in Canopy	Livestock (Grazing)	Planting (Plantation)	Tracks and Trails	Dumping (Rubbish)	Earth Displacement	Recreational Use	Other Human Disturbance
AOI	90	1%	26%	4%	11%	34%	3%	10%	16%	9%
LSA_{TER}	20	0%	5%	15%	5%	15%	0%	0%	5%	5%
LSA_{ECO} N	283	<1%	25%	<1%	8%	12%	3%	1%	12%	2%
LSA_{ECO} S	80	1%	11%	0%	10%	23%	10%	1%	23%	3%

4.3.1.2 Natural Disturbance

Natural disturbance was assessed as part of the overall condition of the plot. A full summary of natural disturbance activities by plot (where disturbance was apparent) is provided in **Table E-4** in **Appendix E**. **Table 4-18** provides the proportion of surveyed plots within each study area with various forms of natural disturbance. Disease and pests resulting in the death of trees was prevalent in the highest proportion of plots within each study area except the LSA_{TER} relative to other natural disturbances. Damage due to browsing by deer and flooding was also prevalent in a large proportion (>40%) of plots within all study areas. Windthrow was prevalent in plots in the LSA_{ECO} both north and south of the AOI and was present in 34% and 25% of plots in the AOI and LSA_{TER}, respectively. Damage due to fire was not present in any of the plots surveyed.

Table 4-18. Proportion of plots surveyed in each study area with natural disturbance.

Study Area	*N* Plots	Disease/ Pest/ Death of Trees	Windthrow (Blowdown)	Browse (e.g., Deer)	Beaver Activity	Flooding (Pools & Puddling)	Fire	Other Natural Disturbances
AOI	90	60%	34%	59%	3%	58%	0%	2%
LSA_{TER}	20	35%	25%	50%	0%	40%	0%	0%
LSA_{ECO} N	283	83%	63%	61%	4%	76%	0%	2%
LSA_{ECO} S	80	78%	64%	56%	4%	53%	0%	1%

5.0 DISCUSSION

5.1 Presence and Distribution of Ecosite Groupings within the BIS Study Areas

When planning infrastructure placement, it is important to consider patterns of presence, sensitivity, use by biota, and relative rarity of ecosites across the landscape. Within the BIS study areas, there are differences in the patterns and distribution of ecosites. North of the AOI, polygons within the LSA_{ECO} are primarily characterized by wetlands such as hardwood swamps and have wetter organic soils throughout much of the landscape. In this northern region, smaller polygons of drier soils and ecosite types such as upland and forest habitats occur along the outer perimeter of the GSWC. A small portion of the southern GSWC protrudes into the LSA_{TER} and AOI. In these areas, the ecosites and soils are similar to the wetland ecosites found in the LSA_{ECO} north of the AOI. Aside from this small wetter region, most of the natural and naturalized lands in the AOI and LSA_{TER} consist of small polygons of dry to fresh ecosites like forests. Meadows and wetter ecosite types (such as swamps and marshes) are primarily found surrounding watercourses and aquatic areas. The LSA_{ECO} south of the AOI is more similar in ecosite distribution and polygon size to the AOI and LSA_{TER} than its northern counterpart. Most natural and naturalized lands in the LSA_{ECO} south of the AOI are comprised of moist to dry ecosite types with wetter ecosites surrounding tributaries and waterbodies and in wetland complexes.

Sensitive ecosites associated with rare vegetation communities that may be considered SWH are discussed further in Appendix C, Chapter 1 of this 2023 BIS Baseline Report. Rare ecosites may provide biota with habitat that would not otherwise be present. Avoiding such ecosites when placing infrastructure could benefit biota if these ecosites are deemed to provide important habitat. Several ecosite groupings were rare throughout the areas mapped within the BIS study areas, including shrub, wetland fen, meadow, conifer swamp, shrub swamp, and marsh ecosites. These areas may provide unique habitat for biota. Several ecosites were only found within the AOI or LSA_{TER}. Dry to Fresh Pine Coarse

Mineral Mixedwood Treed (TRT-MNd4) and Dry to Fresh Fine Non-Calcareous Shrub Meadow (MEW-Sn2) were only found within the AOI and Treed Fen (FEW-T1) was only found within the LSA_{TER} with a very small amount protruding into the LSA_{ECO} north of the AOI. Several other ecosites including Larch Organic Conifer Swamp (SWT-Co4) and Dry to Fresh Coarse Non-Calcareous Shrub Meadow (MEW-Sn1) were primarily found within the AOI with only a small amount in the LSA_{ECO} north of the AOI. These ecosites should be investigated further for their potential importance to biota to determine whether they should be avoided during infrastructure placement.

Polygon size and heterogeneity of ecosites on the landscape differed among study areas, and this impacted the distribution of rare ecosites. The LSA_{ECO} north of the AOI primarily consists of larger consolidated polygons of hardwood swamp with smaller polygons of other ecosites surrounding the swamp, whereas the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI had more even distributions of smaller polygons of various ecosites. Due to the higher variability and smaller ecosite polygons, the southern study areas (AOI, LSA_{TER}, and LSA_{ECO}) had rarer ecosites than the northern LSA_{ECO}. The patterns of ecosite types on the landscape are not surprising as the southern study areas have more human disturbance including agriculture and rural development relative to the northern LSA_{ECO}. These human practices limit the size of ecosite polygons to areas that have remaining natural habitat such as riparian zones and property lines. In addition, property owners may plant certain species (e.g., eastern white cedar) in favour of other species, which may be prevalent in the hedgerows separating properties. Conversely, the lands within the GSWC in the LSA_{ECO} north of the AOI and in the smaller wetland complexes[3] south of the AOI contain lands that have not been modified to the same extent as privately owned lands. Thus, ecosites within these areas remain as larger consolidated polygons with more naturally occurring species.

5.2 Limitations in Vegetation and Habitat Data Collection among Ecosites

Ecosite and habitat data collected during the TEM program will ultimately assist in selecting sampling sites for future Tier 2 biodiversity value community characterization studies. Zoetica's study design was to stratify and randomize field plots according to ecosite occurrence in each study area such that the number of plots by ecosite and survey type would be equally distributed within each study area by proportion of ecosites available. In 2022, field data collection was limited by access to sites within the BIS study areas. As such, the distribution of plots within the study areas was uneven as more public lands were available for survey in the northern portion of the LSA_{ECO} (particularly in the GSWC) than the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI. Surveyed areas within the AOI were comprised mainly of Nuclear Waste Management Organization (NWMO)-owned/optioned lands and private lands. Surveyed areas within the LSA_{TER} and LSA_{ECO} south of the AOI were comprised mainly of private lands with some public lands within the TWC and WWC. As access to private properties requires permission from the landowner, the NWMO focussed their efforts to gain land access to lands primarily within the AOI. Still, several properties within the AOI remained inaccessible, especially in the southern portion. Similarly, the LSA_{TER} and LSA_{ECO} had large proportions of land that were not accessible for surveys.

The limitations to accessibility resulted in Zoetica limiting the stratification of points for survey to within accessible parcels of land regardless of study area. While plots were randomized and stratified on the landscape, study area was not used as a variable because there were not enough available polygons to stratify by survey type (full, ground, or visual) within any given study area. More polygons were available in the LSA_{ECO} north of the AOI, so it was more likely for a polygon within the LSA_{ECO} to be selected. Many ecosites were limited to only one accessible polygon, which Zoetica always assigned a full survey plot. If

more than one polygon was available for a particular ecosite, Zoetica assigned additional ground and visual plots. Because desk-based mapping was limited by leaf-off conditions, many plots originally proposed as full and ground plots were downgraded to visual plots to avoid oversampling in specific hardwood ecosites. These factors combined resulted in assignment of 50 full plots, 59 ground plots and 429 visual plots, of which 5 full, 13 ground, and 84 visual plots were in the AOI. As the proportion of natural and naturalized areas within the AOI relative to the LSA_{ECO} was approximately 5%, the design was proportionally balanced. However, in 2022, only one full plot, 10 ground plots, and 79 visual plots were surveyed by field crews within the AOI. Remaining plots within the AOI were not surveyed because field crews deemed them inaccessible due to unsafe conditions (e.g., flooding of land), landowner permissions not being received in time, or not receiving a utility locate (that is required for full plots) before the end of the sampling season.

The focus of data collection at full and ground plots was to collect much of the habitat and vegetation data required to plan further Tier 2 studies, while the focus of visual plots was to verify ecosite classifications and plot condition. Eventually, the collection of vegetation and habitat data within full and ground plots could be used to make predictions about vegetation and habitat attributes in polygons not accessible or selected for survey, depending on the strength of patterns uncovered. However, as many ecosites did not have many available polygons for survey, it was not possible to determine trends of vegetation and habitat attributes by ecosite type. Instead, only general patterns across the landscape could be assessed. Additional field data collection would allow for more specific predictions in future iterations of the BIS Baseline Report.

5.3 Vegetation and Habitat Trends Across Study Areas

In general, structural stage was consistently greater in the LSA_{ECO} north of the AOI relative to other study areas. In addition, vegetation cover was greater in the tree layer in the LSA_{ECO} north of the AOI relative to other areas where the herb layer cover was greatest. This result was expected, as the GSWC comprises much of the area within the LSA_{ECO} north of the AOI, and disturbances within the GSWC are minimized due to its status as a Provincially Significant Wetland. In addition, the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI had relatively greater portions of ecosites that naturally have lower structural stages (e.g., shrub, meadow, and marsh ecosites). Within the AOI, areas with higher structural stage, stand height, and greater cover in the tree layer were found in plots along the northeastern, eastern, and southern portions of the AOI. However, only 11 plots total were assessed for structural stage and cover within the AOI. The dominant species in structural vegetation layers also differed between the AOI and LSA_{TER} relative to the LSA_{ECO}. In general, the number of species in the older vegetation layers (e.g., A1 tree layer) within the AOI and LSA_{TER} were lower than in the LSA_{ECO}, and the LSA_{ECO} north of the AOI had the most species in these older layers. A similar trend was observed within the shrub layer. The AOI and LSA_{TER} had proportionally more farmland and private properties relative to the LSA_{ECO}. Thus, it is not surprising to encounter less species variability within areas that have been altered for agricultural purposes. Many of the remaining tree stands within the AOI and LSA_{TER} are limited to the perimeter of private properties, riparian areas, and swamp lands that are unsuitable for agriculture.

Other than SWH discussed in Appendix C, Chapter 1, habitat features such as CWD piles and tree attributes for wildlife were assessed only at full plots during TEM surveys unless evidence of use was recorded as incidental observations (see Chapters 2 through 9 for incidental observations of BVs within various study areas). Only one full plot was surveyed in 2022 in the AOI, thus comparisons of these habitat features

within the AOI to other areas is not possible at this time. Habitat features for wildlife recorded during TEM surveys were primarily related to bird activity including perching, nesting, and feeding sites. Additional potential habitat was also documented for bats. Large diameter trees (> 25 cm DBH) with a decay class of 4 or less that contained cavities were recorded as potential bat roosting sites. As bat presence was not recorded it is not possible to determine if potential roosting sites were being used by bats. However, based on monitoring carried out by the Native Bats Conservation Program at the Toronto Zoo, a restricted bat species (M1) is known to be utilizing habitats within the BIS study areas (Thorne et al. 2021, Sparrow-Scinocca et al. 2022), and thus it is possible that some potential tree roosting sites could be used by at-risk bats (see Section 6.0, Chapter 4). In addition to birds and bats, one plot in the LSA_{ECO} north of the AOI had a tree containing a denning site for an unknown species, and one plot in the southern section of the LSA_{ECO} had a tree with evidence of white-tailed deer markings. These data demonstrate the potential use of the habitat in and surrounding the AOI by various wildlife species. Additional Tier 1 TEM studies, and future Tier 2 studies in the AOI and surrounding study areas will be conducted to further ascertain the value of habitats within these study areas for wildlife.

5.4 Health and Condition of Habitats Across Study Areas

Forest health was assessed at full plots for various factors including tree health, standing snags, and deer browse. At all plots visited, disturbance due to logging, human disturbance and natural disturbance were recorded. Results of tree health demonstrated that at nearly all plots that contained ash trees, evidence of emerald ash borer was present. Only four plots containing ash did not have evidence of EAB. Ash trees were more prevalent in the LSA_{ECO} north of the AOI; no full plots surveyed within the AOI or LSA_{TER} contained ash trees and only one full plot surveyed in the LSA_{ECO} south of the AOI contained ash trees. This plot did not have evidence of EAB. EAB was also recorded incidentally during other BIS field surveys within the AOI and in the LSA_{ECO} south of the AOI (see Chapter 9). Emerald ash borer is an invasive beetle native to northeastern Asia that is known to spread rapidly among ash trees to feed on them, resulting in tree death (NRCan 2020). Without control measures to manage EAB, all trees infested by EAB are expected to die within approximately 10 years (NRCan 2020). Observations of EAB are likely a concern for forest health, particularly in locations where the presence of ash species is higher. Beech bark disease was also noted in one plot in the LSA_{ECO} south of the AOI. Only three full plots were noted to contain beech trees, two of which occurred in the LSA_{ECO} north of the AOI. Additional surveys are recommended within treed plots in the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI to document the presence of ash, beech, EAB, and BBD.

Disturbance due to logging, human disturbance, and natural disturbance was prevalent in most plots surveyed. Most evidence of logging was from activities that occurred greater than 30 years ago. However, more recent logging activities (within the past 15 years) was documented in a greater proportion within the AOI and LSA_{TER} relative to the LSA_{ECO} north and south of the AOI. However, at most plots, the extent and intensity of recent logging was more localized and lighter to moderate relative to logging conducted greater than 15 years ago. The extent and intensity of logging was most extensive and heavy in plots with evidence of logging greater than 30 years ago.

5.5 Next Steps

Data collected in 2022 were limited to accessible parcels of land including publicly owned lands, NWMO-owned/optioned lands, conservation authority lands, and private lands where private property owners have granted permission. As a result, planned plots for the 2022 field season could not fulfill the TEM

recommendation to survey at a Level 2 (51-75% of polygons) within the relative study areas with a ratio of 3:17:80 for full, ground, and visual plots. Data collected at these recommended ratios can be used to further update desk-based mapping. For many of the desk-based mapped ecosites within the BIS study areas, only one or a few polygons were accessible for survey. Thus, it was not possible for Zoetica to assess trends in the data relative to ecosites and the focus of the 2023 Baseline Report shifted to look at general patterns on the landscape instead of at the ecosite level. In addition, as only one full plot and 10 ground plots were surveyed within the AOI, vegetation and habitat information within the AOI was limited to 11 polygons.

Vegetation and habitat attributes are important for planning future Tier 2 BV Studies. Ideally, vegetation and habitat attributes collected at full and ground plots can be summarized by ecosite and these attributes can be assumed at the same ecosites in polygons that have not been field-verified. However, due to the large number of ecosites (99 ecosites excluding aquatic habitat – see **Table C-2** in **Appendix C**) within the BIS study areas, many ecosites only had one full or ground plot surveyed and some only had visual plots surveyed where vegetation and habitat data are not collected; thus, it is not possible to predict relationships between ecosites and vegetation and habitat variables at this time.

Zoetica recommends continued Tier 1 TEM studies to meet the Level 2 survey recommendations prior to site selection. Since most full plots to date were located in the northern portion of the LSA_{ECO} due to the availability of accessible polygons in the GSWC, Zoetica recommends focussing additional TEM studies in the AOI and LSA_{TER} and in representative areas within the LSA_{ECO} south of the AOI using full and ground survey plots to understand vegetation and habitat information across these study areas. Zoetica understands that additional property access will likely be required to ensure enough polygons in the AOI, LSA_{TER}, and LSA_{ECO} south of the AOI can be surveyed. Additional Tier 1 TEM effort within the LSA_{ECO} north of the AOI can be limited to any remaining data gaps. Best practices also recommend surveying 100% of the area where infrastructure will be placed at a ratio of 2:15:83 full:ground:visual plots. Once an Initial Project Description including potential infrastructure placement is known, and if the SON-South Bruce site is selected, continued Tier 1 TEM studies should be conducted in 100% of the polygons overlapping with project infrastructure. This surveying will ensure adequate vegetation and habitat information is collected so that project impacts can be credibly predicted, the mitigation hierarchy applied, and opportunities for benefit/enhancement can be pursued.

APPENDIX A – SPECIES LIST

Table A-1. Common and scientific names for species mentioned in this Appendix B, Chapter 1. Species names follow the NHIC's Ontario species lists (current to March 1, 2023).

Common Name	Scientific Name
Vegetation	
Alder	*Alnus* spp.
Alder-leaved buckthorn	*Endotropis alnifolia*
Allegheny blackberry	*Rubus allegheniensis*
Alternate-leaved dogwood	*Cornus alternifolia*
American beech	*Fagus grandifolia*
American black currant	*Ribes americanum*
American golden-saxifrage	*Chrysosplenium americanum*
American hazelnut	*Corylus americana*
American hog-peanut	*Amphicarpaea bracteata*
American hop-hornbeam	*Ostrya virginiana*
American royal fern	*Osmunda regalis var. spectabilis*
American tree moss	*Climacium americanum*
American water pennywort	*Hydrocotyle americana*
American water-horehound	*Lycopus americanus*
American woodland strawberry	*Fragaria vesca* ssp. *americana*
Andrews' bottle gentian	*Gentiana andrewsii*
Annual fleabane	*Erigeron annuus*
Arrowhead	*Sagittaria* spp.
Ash	*Fraxinus* spp.
Aspen	*Populus* spp.
Aster sp.	*Aster* sp.*; Symphyotrichum sp.*
Autumn olive	*Elaeagnus umbellata*
Avens	*Geum* sp.
Awl-fruited sedge	*Carex stipata*
Balsam fir	*Abies balsamea*
Baneberry	*Actaea* spp.
Barren strawberry	*Geum fragarioides*
Basswood	*Tilia americana*
Beaked hazelnut	*Corylus cornuta*
Bearded sedge	*Carex comosa*
Bebb's willow	*Salix bebbiana*
Bebb's sedge	*Carex bebbii*
Bedstraw	*Galium* spp.
Beech bark disease (fungus)	*Neonectria faginata; N. ditissima*
Birch	*Betula* spp.

Bird vetch	*Vicia cracca*
Bittersweet nightshade	*Solanum dulcamara*
Black ash	*Fraxinus nigra*
Black cherry	*Prunus serotina*
Black medick	*Medicago lupulina*
Black raspberry	*Rubus occidentalis*
Black walnut	*Juglans nigra*
Black-eyed Susan	*Rudbeckia hirta* var. *pulcherrima*
Bladder campion	*Silene vulgaris*
Bladder sedge	*Carex intumescens*
Blue cohosh	*Caulophyllum* sp.
Blue vervain	*Verbena hastata*
Blue-beech	*Carpinus caroliniana*
Bluejoint reedgrass	*Calamagrostis canadensis*
Blunt broom sedge	*Carex tribuloides*
Bog goldenrod	*Solidago uliginosa*
Bracken fern	*Pteridium aquilinum*
Bristle-leaved sedge	*Carex eburnea*
Bristle-stalked sedge	*Carex leptalea*
Bristly black currant	*Ribes lacustre*
Bristly dewberry	*Rubus hispidus*
Bristly greenbrier	*Smilax tamnoides*
Broad-leaved cattail	*Typha latifolia*
Broad-leaved enchanter's nightshade	*Circaea canadensis*
Broad-leaved helleborine	*Epipactis helleborine*
Brownish sedge	*Carex brunnescens*
Bryophytes	*Bryophyte* sp.
Bulblet bladder fern	*Cystopteris bulbifera*
Bulbous water-hemlock	*Cicuta bulbifera*
Bull thistle	*Cirsium vulgare*
Bunchberry	*Cornus canadensis*
Bur oak	*Quercus macrocarpa*
Calico aster	*Symphyotrichum lateriflorum*
Callicladium moss	*Callicladium* sp.
Canada anemone	*Anemonastrum canadense*
Canada avens	*Geum canadense*
Canada fly honeysuckle	*Lonicera canadensis*
Canada goldenrod	*Solidago canadensis* var. *canadensis*
Canada lettuce	*Lactuca canadensis*
Canada mint	*Mentha canadensis*

Canada moonseed	*Menispermum canadense*
Canada thistle	*Cirsium arvense*
Canada yew	*Taxus canadensis*
Canadian wild-ginger	*Asarum canadense*
Canadian wood nettle	*Laportea canadensis*
Cardinal flower	*Lobelia cardinalis*
Cattail	*Typha* spp.
Cedar	*Thuja* spp.
Cherry	*Prunus* spp.
Chokecherry	*Prunus virginiana*
Christmas fern	*Polystichum acrostichoides*
Cinnamon fern	*Osmundastrum cinnamomeum*
Coltsfoot	*Tussilago farfara*
Common apple	*Malus pumila*
Common boneset	*Eupatorium perfoliatum*
Common burdock	*Arctium minus*
Common buttercup	*Ranunculus acris*
Common dandelion	*Taraxacum officinale*
Common elderberry	*Sambucus canadensis*
Common hackberry	*Celtis occidentalis*
Common hawkweed	*Hieracium lachenalii*
Common hemp-nettle	*Galeopsis tetrahit*
Common Labrador tea	*Rhododendron groenlandicum*
Common marsh bedstraw	*Galium palustre*
Common milkweed	*Asclepias syriaca*
Common mullein	*Verbascum thapsus*
Common oak fern	*Gymnocarpium dryopteris*
Common speedwell	*Veronica officinalis*
Common St. John's-wort	*Hypericum perforatum*
Common reed	*Phragmites australis; Phragmites spp.*
Common timothy	*Phleum pratense*
Common water-parsnip	*Sium suave*
Common water-plantain	*Alisma plantago-aquatica*
Common winterberry	*Ilex verticillata*
Common woolly bulrush	*Scirpus cyperinus*
Common yarrow	*Achillea millefolium*
Cottony willow	*Salix eriocephala*
Creeping bentgrass	*Agrostis stolonifera*
Creeping Foamflower	*Tiarella stolonifera*
Crested sedge	*Carex cristatella*

Crested wood fern	*Dryopteris cristata*
Curled dock	*Rumex crispus*
Currant	*Ribes* spp.
Cyperus-like sedge	*Carex pseudocyperus*
Dandelion sp.	*Taraxacum* sp.
Dark-green bulrush	*Scirpus atrovirens*
Delicate fern moss	*Thuidium delicatulum*
Deptford pink	*Dianthus armeria*
Devil's beggarticks	*Bidens frondosa*
Divine bogmoss	*Sphagnum divinum*
Dock	*Rumex* sp.
Dotted hawthorn	*Crataegus punctata*
Dotted leafy moss	*Rhizomnium punctatum*
Drooping woodland sedge	*Carex arctata*
Drooping woodreed	*Cinna latifolia*
Dudley's rush	*Juncus dudleyi*
Dwarf blackberry	*Rubus pubescens*
Dwarf clearweed	*Pilea pumila*
Dwarf scouring-rush	*Equisetum scirpoides*
Early meadow-rue	*Thalictrum dioicum*
Eastern cottonwood	*Populus deltoides*
Eastern hemlock	*Tsuga canadensis*
Eastern marsh fern	*Thelypteris palustris* var. *pubescens*
Eastern ninebark	*Physocarpus opulifolius*
Eastern panicled aster	*Symphyotrichum lanceolatum* ssp. *lanceolatum*
Eastern poison ivy	*Toxicodendron radicans* var. *radicans*
Eastern prickly gooseberry	*Ribes cynosbati*
Eastern riverbank wildrye	*Elymus riparius*
Eastern rough sedge	*Carex scabrata*
Eastern skunk cabbage	*Symplocarpus foetidus*
Eastern star sedge	*Carex radiata*
Eastern tall goldenrod	*Solidago altissima* var. *altissima*
Eastern teaberry	*Gaultheria procumbens*
Eastern white cedar / white cedar	*Thuja occidentalis*
Eastern white pine / white pine	*Pinus strobus*
English plantain	*Plantago lanceolata*
European buckthorn	*Rhamnus cathartica*
European red currant	*Ribes rubrum*
Evergreen wood fern	*Dryopteris intermedia*
False waterpepper	*Persicaria hydropiperoides*

Field horsetail	*Equisetum arvense*
Field pussytoes	*Antennaria neglecta*
Finely-nerved sedge	*Carex leptonervia*
Flat-branched tree-clubmoss	*Dendrolycopodium obscurum*
Flat-top white aster	*Doellingeria umbellata*
Flat-topped white aster	*Symphyotrichum umbellatum*
Forkmoss	*Dicranum* sp.
Fowl bluegrass	*Poa palustris*
Fowl mannagrass	*Glyceria striata*
Fox sedge	*Carex vulpinoidea*
Fraser's St. John's-wort	*Triadenum fraseri*
Freeman's maple	*Acer x freemanii*
Fringed milkwort	*Polygaloides paucifolia*
Fringed orchid sp.	*Platanthera* sp.
Fringed sedge	*Carex crinita*
Fringed yellow loosestrife	*Lysimachia ciliata*
Garden bird's-foot trefoil	*Lotus corniculatus*
Giant blue cohosh	*Caulophyllum giganteum*
Giant goldenrod	*Solidago gigantea*
Giant Solomon's seal	*Polygonatum biflorum*
Glossy buckthorn	*Grangula alnus*
Glossy-leaved aster	*Symphyotrichum firmum*
Goldenrod sp.	*Solidago* spp.
Goldthread	*Coptis trifolia*
Graceful sedge	*Carex gracillima*
Graminoid	*Graminoid* sp.
Grapevine sp.	*Vitis* sp.
Grass-leaved goldenrod	*Euthamia graminifolia*
Great blue lobelia	*Lobelia siphilitica*
Greater water dock	*Rumex britannica*
Green ash / red ash	*Fraxinus pennsylvanica*
Green-fruited burreed	*Sparganium emersum*
Grey dogwood	*Cornus racemosa*
Haircap moss	*Polytrichum* spp.
Hairy green sedge	*Carex hirsutella*
Hairy Solomon's seal	*Polygonatum pubescens*
Handsome woollywort	*Trichocolea tomentella*
Hard-stemmed bulrush	*Schoenoplectus acutus*
Harlequin blue flag	*Iris versicolor*
Hawkweed sp.	*Hieracium* sp.

Hawthorn	*Crataegus* spp.
Heart-leaved Foamflower	*Tiarella cordifolia*
Hemlock	*Tsuga* spp.
Hemp dogbane	*Apocynum cannabinum*
Herb-robert	*Geranium robertianum*
Hidden spikemoss	*Selaginella eclipes*
Highbush cranberry	*Viburnum opulus* var. *americanum*
Honeysuckle	*Lonicera* spp.
Hooked agrimony	*Agrimonia gryposepala*
Hooked buttercup	*Ranunculus recurvatus*
Hop sedge	*Carex lupulina*
Horsetail spp.	*Equisetum* spp.
Indian cucumber-root	*Medeola virginiana*
Indian-pipe	*Monotropa uniflora*
Inland sedge	*Carex interior*
Interrupted fern	*Osmunda claytoniana*
Iris sp.	*Iris* sp.
Jack-in-the-pulpit	*Arisaema triphyllum*
Kentucky bluegrass	*Poa pratensis*
Kidney-leaved buttercup	*Ranunculus abortivus*
Knapweed	*Centaurea* sp.
Labrador violet	*Viola labradorica*
Lake sedge	*Carex lacustris*
Lance-leaved selfheal	*Prunella vulgaris* ssp. *lanceolata*
Large false solomon's seal	*Maianthemum racemosum*
Large-toothed aspen	*Populus grandidentata*
Leafy moss	*Mnium* sp.
Leatherleaf	*Chamaedaphne calyculata*
Limber honeysuckle	*Lonicera dioica*
Long-stalked sedge	*Carex pedunculata*
Mackay's brittle fern	*Cystopteris tenuis*
Mad-dog skullcap	*Scutellaria lateriflora*
Maple	*Acer* spp.
Marginal wood fern	*Dryopteris marginalis*
Maroon cucumber	*Cucumis anguria*
Marsh bellflower	*Palustricodon aparinoides*
Marsh cinquefoil	*Comarum palustre*
Marsh grass-of-parnassus	*Parnassia palustris*
Marsh horsetail	*Equisetum palustre*
Marsh mermaidweed	*Proserpinaca palustris*

Marsh seedbox	*Ludwigia palustris*
Marsh vetchling	*Lathyrus palustris*
Maryland sanicle	*Sanicula marilandica*
Meadow ryegrass	*Lolium pratense*
Meadow willow	*Salis petiolaris*
Mexican muhly	*Muhlenbergia mexicana* var. *mexicana*
Mountain holly	*Ilex mucronata*
Mountain maple	*Acer spicatum*
Multiflora rose	*Rosa multiflora*
Naked mitrewort	*Mitella nuda*
Nannyberry	*Viburnum lentago*
Narrow-leaved cattail	*Typha angustifolia*
New England aster	*Symphyotrichum novae-angliae*
Ninebark	*Physocarpus* spp.
Nodding beggarticks	*Bidens cernua*
North American red raspberry	*Rubus idaeus* ssp. *strigosus*
Northeastern lady fern	*Athyrium filix-femina* var. *angustum*
Northern rough-stemmed goldenrod	*Solidago rugosa* ssp. *rugosa* var. *rugosa*
Northern sea oats	*Chasmanthium latifolium*
Northern shorthusk	*Brachyelytrum aristosum*
Northern spicebush	*Lindera benzoin*
Northern starflower	*Lysimachia borealis*
Northern swamp buttercup	*Ranunculus caricetorum*
Northern tree moss	*Climacium dendroides*
Northern water-horehound	*Lycopus uniflorus*
Northern willowherb	*Epilobium ciliatum*
Norway spruce	*Picea abies*
Oak	*Quercus* spp.
Old field aster	*Symphyotrichum pilosum*
Ontario aster	*Symphyotrichum ontarionis*
Orange hawkweed	*Pilosella aurantiaca*
Orchard grass	*Dactylis glomerata*
Ostrich fern	*Matteuccia struthiopteris* var. *pensylvanica*
Oval sedge	*Carex ovalis*
Oxeye daisy	*Leucanthemum vulgare*
Pale jewelweed	*Impatiens pallida*
Panicgrass	*Dichanthelium* sp.
Partridgeberry	*Mitchella repens*
Path rush	*Juncus tenuis*
Pennsylvania buttercup	*Ranunculus pensylvanicus*

Pennsylvania sedge	*Carex pensylvanica*
Philadelphia fleabane	*Erigeron philadelphicus*
Pine	*Pinus* spp.
Pink lady's-slipper	*Cypripedium acaule*
Pink pyrola	*Pyrola asarifolia*
Plantain-leaved sedge	*Carex plantaginea*
Plume moss	*Ptilium* sp.
Pocket moss	*Fissidens* sp.
Poison ivy	*Toxicodendron radicans; Toxicodendron* spp.
Poplar	*Populus* spp.
Porcupine sedge	*Carex hystericina*
Poverty oatgrass	*Danthonia spicata*
Purple chokeberry	*Aronia x prunifolia*
Purple false medic	*Schizachne purpurascens*
Purple-stemmed angelica	*Angelica atropurpurea*
Purple-stemmed aster	*Symphyotrichum puniceum*
Purple-stemmed beggarticks	*Bidens connata*
Purple-veined willowherb	*Epilobium coloratum*
Purslane speedwell	*Veronica peregrina* ssp. *peregrina*
Pussy willow	*Salix discolor*
Red baneberry	*Actaea rubra*
Red clover	*Trifolium pratense*
Red elderberry	*Sambucus racemose*
Red maple	*Acer rubrum*
Red oak / Northern red oak	*Quercus rubra*
Red pine	*Pinus resinosa*
Red trillium	*Trillium erectum*
Red-osier dogwood	*Cornus sericea*
Red-stemmed feathermoss	*Pleurozium schreberi*
Redtop	*Agrostis gigantea*
Reed canarygrass	*Phalaris arundinacea*
Rice cutgrass	*Leersia oryzoides*
Riparian feather moss	*Leptodictyum riparium*
Riverbank grape	*Vitis riparia*
Rosy sedge	*Carex rosea*
Rough avens	*Geum laciniatum*
Rough bedstraw	*Galium asprellum*
Rough cinquefoil	*Potentilla norvegica*
Round-leaved dogwood	*Cornus rugosa*
Royal fern	*Osmunda regalis*

Sandbar willow	*Salix interior*
Sedge	*Carex* spp.
Sensitive fern	*Onoclea sensibilis*
Serviceberry	*Amelanchier* spp.
Shining firmoss	*Huperzia lucidula*
Shinleaf	*Pyrola elliptica*
Shiny golden fuzzy moss	*Tomentypnum nitens*
Shorthusk sp.	*Brachyelytrum* sp.
Showy fleabane	*Erigeron speciosus*
Silky dogwood	*Cornus obliqua*
Silver maple	*Acer saccharinum*
Slender false brome	*Brachypodium sylvaticum*
Slender stinging nettle	*Urtica gracilis*
Slender yellow woodsorrel	*Oxalis dillenii*
Small duckweed	*Lemna minor*
Small enchanter's nightshade	*Circaea alpina*
Small-spike false nettle	*Boehmeria cylindrica*
Smartweed sp.	*Persicaria* sp.
Smooth bedstraw	*Galium mollugo*
Smooth brome	*Bromus inermis*
Soft rush	*Juncus effusus*
Soft-stemmed bulrush	*Schoenoplectus tabernaemontani*
Southern shorthusk	*Brachyelytrum erectum*
Southern swamp buttercup	*Ranunculus septentrionalis*
Speckled alder	*Alnus incana* ssp. *rugosa*
Sphagnum	*Sphagnum* spp.
Spikerush sp.	*Eleocharis* sp.
Spinulose wood fern	*Dryopteris carthusiana*
Spotted geranium	*Geranium maculatum*
Spotted jewelweed	*Impatiens capensis*
Spotted joe-pye weed	*Eutrochium maculatum* var. *maculatum*
Spotted knapweed	*Centaurea stoebe ssp. micranthos*
Spotted lady's-thumb	*Persicaria maculosa*
Spotted water-hemlock	*Cicuta maculata* var. *maculata*
Spreading dogbane	*Apocynum androsaemifolium*
Spruce	*Picea* spp.
Stairstep moss	*Hylocomium splendens*
Star-flowered false solomon's seal	*Maianthemum stellatum*
Stout woodreed	*Cinna arundinacea*
Sugar maple	*Acer saccharum*

Sulphur cinquefoil	*Potentilla recta*
Swamp dodder	*Cuscuta gronovii*
Swamp milkweed	*Asclepias incarnata*
Swamp red currant	*Ribes triste*
Swamp rose	*Rosa palustris*
Swamp white oak	*Quercus bicolor*
Swamp yellow loosestrife	*Lysimachia terrestris*
Tall anemone	*Anemone virginiana* var. *virginiana*
Tall meadow-rue	*Thalictrum pubescens*
Tamarack / Larch	*Larix laricina*
Tender sedge	*Carex tenera*
Thicket creeper	*Parthenocissus vitacea*
Three-flowered bedstraw	*Galium triflorum*
Three-leaved Rattlesnake-root	*Nabalus trifoliolatus*
Three-parted beggarticks	*Bidens tripartita*
Three-seeded sedge	*Carex trisperma*
Three-way sedge	*Dulichium arundinaceum*
Trembling aspen	*Populus tremuloides*
Tufted yellow loosestrife	*Lysimachia thyrsiflora*
Tussock sedge	*Carex stricta*
Twinleaf	*Jeffersonia diphylla*
Two-leaved mitrewort	*Mitella diphylla*
Two-leaved toothwort	*Cardamine diphylla*
Two-seeded sedge	*Carex disperma*
Velvet-leaved blueberry	*Vaccinium myrtilloides*
Violet	*Viola* spp.
Virginia chain fern	*Anchistea virginica*
Virginia clematis	*Clematis virginiana*
Virginia creeper	*Parthenocissus quinquefolia*
Virginia stickseed	*Hackelia virginiana*
Virginia wildrye	*Elymus virginicus* var. *virginicus*
Water beggarticks	*Bidens beckii*
Water sedge	*Carex aquatilis*
Water smartweed	*Persicaria amphibia*
Watercress sp.	*Nasturtium* sp.
Western poison-ivy	*Toxicodendron radicans* var. *rydbergii*
White birch / paper birch	*Betula papyrifera*
White clover	*Trifolium repens*
White elm	*Ulmus americana*
White heath aster	*Symphyotrichum ericoides* var. *ericoides*

White meadowsweet	*Spiraea alba*
White oak	*Quercus alba*
White rattlesnakeroot	*Nabalus albus*
White snakeroot	*Ageratina altissima*
White spruce	*Picea glauca*
White sweet-clover	*Melilotus albus*
White trillium	*Trillium grandiflorum*
White turtlehead	*Chelone glabra*
White-fringed orchid	*Platanthera blephariglottis*
Wild basil	*Clinopodium vulgare*
Wild calla	*Calla palustris*
Wild carrot	*Daucus carota*
Wild cucumber	*Echinocystis lobata*
Wild lily-of-the-valley	*Maianthemum canadense*
Wild sarsaparilla	*Aralia nudicaulis*
Wild strawberry	*Fragaria virginiana*
Willow	*Salix* spp.
Wintergreen sp.	*Pyrola* spp.
Wood nettle	*Laportea* spp.
Woodreed	*Cinna* sp.
Woodsy leafymoss	*Plagiomnium cuspidatum*
Yellow avens	*Geum aleppicum*
Yellow birch	*Betula alleghaniensis*
Yellow clintonia	*Clintonia borealis*
Yellow marsh marigold	*Caltha palustris*
Yellow sedge	*Carex flava*
Yellow Violet	*Viola pubescens*
Mammals	
Bat	Chiroptera order
Beaver	*Castor canadensis*
Black bear	*Ursus americanus*
Cattle	*Bos taurus*
Coyote	*Canis latrans*
Little brown myotis	*Myotis lucifugus*
Squirrel	Sciuridae family
White-tailed deer / Deer	*Odocoileus virginianus*
Herpetofauna	
Eastern gartersnake	*Thamnophis sirtalis sirtalis*
Salamander	Urodela order
Terrestrial Invertebrates	

Bee hive boxes (European honeybee)	*Apis mellifera*
Emerald ash borer	*Agrilus planipennis*
Birds	
American robin	*Turdus migratorius*
Woodpecker	Picidae family
Yellow-bellied sapsucker / Sapsucker	*Sphyrapicus varius*

Notes:
1. For the purposes of this table, the study areas cover the entire study area, including any overlap with other study areas.
2. Mapping was completed in natural and naturalized areas.
3. The intensity of green shading indicate ecosites that are more prominent (darker shading) versus those that are less prominent (lighter shading) in each study area. Grey shading indicates ecosites that have not been mapped within a study area.

Notes:
1. For the purposes of this table, the study areas cover the entire study area, including any overlap with other study areas.
2. Mapping was completed in natural and naturalized areas.
3. The intensity of green shading indicate ecosites that are more prominent (darker shading) versus those that are less prominent (lighter shading) in each study area. Grey shading indicates ecosites that have not been mapped within a study area.

Table C-3. Comparison of ecosite groupings for sites classified in desk-based mapping versus the field-based classification. Sample sizes (*n*) are provided for the number of sites classified as each ecosite grouping in desk-based data. Numbers are the percentages of the desk-based ecosite grouping (row) that were classified as each grouping in the field. Green conditional formatting highlights highest percentage classifications. Cells outlined in black indicate desk-based classifications did not change upon field verification. Greyed headers are ecosite groupings that were recorded in the field, but not the desk-based data.

Table C-4a. Comparison of ecosites classified in desk-based mapping versus the field-based classification, for those classified as upland in the desk-based data that stayed upland in the field data. Sample sizes (*n*) are provided for the number of sites classified as each ecosite in desk-based data. Numbers are the percentages of the desk-based ecosite (row) that were classified as each ecosite in the field. Green conditional formatting highlights highest percentage classifications. Cells outlined in black indicate desk-based classifications did not change upon field verification. Greyed headers are ecosites that were recorded in either desk- or field-based data (depending on whether they are a row or column header), but not the other dataset.

Table C-4a. Comparison of ecosites classified in desk-based mapping versus the field-based classification, for those classified as upland in the desk-based data that stayed upland in the field data. Sample sizes (n) are provided for the number of sites classified as each ecosite in desk-based data. Numbers are the percentages of the desk-based ecosite (row) that were classified as each ecosite in the field. Green conditional formatting highlights highest percentage classifications. Cells outlined in black indicate desk-based classifications did not change upon field verification. Greyed headers are ecosites that were recorded in either desk- or field-based data (depending on whether they are a row or column header), but not the other dataset.

Table D-1. Summary of plots for each vegetation layer within the study areas.

Layer Type	AOI and LSA_{TER}	North of the AOI	South of the AOI
Veteran Trees	1	13	4
A1 Layer	4	33	8
A2 Layer	8	54	10
A3 Layer	7	50	11
B1 Layer	9	54	11
B2 Layer	11	55	10
C Layer	13	57	13
D Layer	7	46	5
E Layer	3	15	2

Invasive Species at Each Plot

No Invasive Species

For each full and ground plot with invasive species:
1) shape of the symbol indicates the extent
2) size of the symbol indicates the abundance
3) colour of the symbol indicates the distribution

Extent
- Local
- Widespread
- Extensive

Abundance
- Rare
- Occasional
- Abundant
- Dominant

Distribution
- Patchy
- Scattered
- Uniform

December 13, 2023	Map ID: NWMO_BIS_D177	

Table D-2. Vegetation species in the tree layer at plots surveyed within the study areas. Species of potential health concern due to disease and pests are highlighted in blue (BBD concern) and green (EAB concern). Species common and scientific names reported according to the NHIC Ontario species lists current to March 1, 2023.

Notes:
1. For each sublayer (A1, A2, A3), the count of sites only includes sites where the species was present in more than trace amounts (> 5%).
2. The intensity of green shading indicates those species that are detected more often within surveyed plots (darker shading) versus those that were detected less often (lighter shading).
3. The intensity of orange shading indicates species that, when present within a surveyed plot, comprise a greater percentage of a vegetation layer (darker shading) relative to other species (lighter shading).

Table D-3. Vegetation species in the shrub layer at plots surveyed within the study areas. Species of potential health concern due to disease and pests are highlighted in blue (BBD concern) and green (EAB concern). Species common and scientific names reported according to the NHIC Ontario species lists current to March 1, 2023.

1. For each sublayer (A1, A2, A3), the count of sites only includes sites where the species was present in more than trace amounts (> 5%).
2. The intensity of green shading indicates those species that are detected more often within surveyed plots (darker shading) versus those that were detected less often (lighter shading).
3. The intensity of orange shading indicates species that, when present within a surveyed plot, comprise a greater percentage of a vegetation layer (darker shading) relative to other species (lighter shading).

Table D-4. Vegetation species in the herb layer at plots surveyed within the study areas. Species of potential health concern due to disease and pests are highlighted in blue (BBD concern) and green (EAB concern).

Notes:
The intensity of green shading indicates those species that are detected more often within surveyed plots (darker shading) versus those that were detected less often (lighter shading).
The intensity of orange shading indicates species that, when present within a surveyed plot, comprise a greater percentage of a vegetation layer (darker shading) relative to other species (lighter shading).

1. *Alisma plantago-aquatica* has been divided into *Alisma subcordatum* (southern water plantain) and *Alisma triviale* (northern water-plantain) as per NHIC.
2. *Erigeron speciosus* occurs in western North America, so this is likely a record of a different *Erigeron* species.
3. *Tiarella cordifolia* changed name to *Tiarella stolonifera*, which makes it the same species as the one below.

Table D-5. Vegetation species in the moss, lichen, liverwort, and seedling layer within plots in the study areas. Species of potential health concern due to disease and pests are highlighted in blue (BBD concern) and green (EAB concern).

Notes:
1. The intensity of green shading indicates those species that are detected more often within surveyed plots (darker shading) versus those that were detected less often (lighter shading).
2. The intensity of orange shading indicates species that, when present within a surveyed plot, comprise a greater percentage of a vegetation layer (darker shading) relative to other species (lighter shading).

Table D-6. Vegetation species present in the epiphyte layer in plots within the study areas.

December 13, 2023	Map ID: NWMO_BIS_D179	

Table E-1. Summary of logging disturbance in plots surveyed in the BIS study areas.

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Logging Field Notes
TEM_002	Full	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence but area is clear and was likely logged in the past.
TEM_003	Full	F	--	--	--	--	--	--	--	--	--	yes	3	3	Area used to be pasture (landowner says until 3 years ago). No actual evidence (stumps) present but area presumed to have been logged
TEM_007	Full	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_008	Full	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_009	Full	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_010	Full	G	--	--	--	--	--	--	yes	2	2	--	--	--	Cedar stumps easily visible throughout plot
TEM_011	Full	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_012	Full	E	--	--	--	--	--	--	--	--	--	yes	1	1	A few old large stumps that look to be cut (might not be) but majority of trees are relatively mature (spared from logging)
TEM_013	Full	G	--	--	--	--	--	--	--	--	--	yes	3	3	Given young age of tree's, site was logged but >30 years ago. No logging damage on standing trees.
TEM_014	Full	G	--	--	--	--	--	--	--	--	--	yes	1	2	A few stumps that could have been cut, may have fallen due to natural causes. Area mix of more mature and younger vegetation.
TEM_015	Full	G	--	--	--	--	--	--	--	--	--	yes	2	2	A few cut stumps, area is very young so logging is assumed to have taken place
TEM_017	Full	G	--	--	--	--	--	--	--	--	--	yes	3	3	No stumps visible, but evidence of historical clearance.
TEM_018	Full	E	--	--	--	--	--	--	--	--	--	yes	2	2	A few stumps that may have been cut in the past, area mix of more mature and younger trees (suggesting selective logging in past)
TEM_019	Full	G	--	--	--	--	--	--	--	--	--	yes	3	2	Logging was probably > 100 years ago
TEM_020	Full	G	--	--	--	--	--	--	--	--	--	yes	3	3	Completely regenerated plantation, no evidence of logging since planting
TEM_021	Full	G	--	--	--	yes	1	2	--	--	--	--	--	--	Ashes cut ahead of EAB. Also historical logging evident (30+ years).
TEM_023	Full	G	--	--	--	--	--	--	--	--	--	yes	2	2	Not much evidence of logging, maybe a few cut stumps but hard to tell if cut or just fallen trees. Area not old growth so presumed to be selectively logged in the past
TEM_026	Full	G	--	--	--	--	--	--	--	--	--	yes	3	2	No evidence of stumps, but evidence of cultural disturbance
TEM_028	Full	G	--	--	--	yes	1	1	--	--	--	--	--	--	
TEM_029	Full	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_030	Full	G	--	--	--	--	--	--	--	--	--	yes	3	3	Cut at some point in the past
TEM_031	Full	F	--	--	--	--	--	--	--	--	--	yes	1	2	Plantation stand, previously forested 80+ years ago.
TEM_033	Full	F	--	--	--	--	--	--	--	--	--	yes	3	2	The monoculture of White Pine, of uniform stand age, suggests this area was cleared historically and the conifer plantation established on land that was previously meadow or agricultural field greater than 30 years ago.
TEM_036	Ground	P	--	--	--	--	--	--	--	--	--	yes	3	3	Area likely clear cut in past to make pasture
TEM_037	Ground	F	--	--	--	--	--	--	--	--	--	yes	3	3	Meadow community historically clear, no logs or stumps present
TEM_041	Ground	G	--	--	--	--	--	--	--	--	--	yes	1	2	Very old stumps from historical logging
TEM_043	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_045	Ground	E	--	--	--	--	--	--	--	--	--	yes	3	3	Visual evidence of logging such as old cut rotting stumps, it is assumed area was logged 30+ years ago
TEM_046	Ground	G	--	--	--	--	--	--	yes	2	2	--	--	--	--
TEM_047	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging, hard to tell if stumps were cut or fell naturally. Mature white pine all seem to be the same age and appear to be too close to be naturally occurring - appear to be in lines so probably planted
TEM_048	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_049	Ground	F	--	--	--	--	--	--	yes	2	2	--	--	--	--
TEM_055	Ground	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_056	Ground	F	--	--	--	--	--	--	yes	3	2	--	--	--	Heavy logging along certain paths within polygon
TEM_059	Ground	E	--	--	--	--	--	--	--	--	--	yes	1	1	--

TEM_061	Ground	E	--	--	--	--	--	--	--	--	--	yes	2	3	
TEM_062	Ground	P	--	--	--	--	--	--	--	--	--	yes	3	3	Clear cut of original community; no stumps or signs of logging other than previous community no longer present
TEM_066	Ground	G	--	--	--	--	--	--	--	--	--	yes	3	3	No damage from logging to existing trees. Logging was probably >100yrs ago
TEM_069	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_071	Ground	G	--	--	--	--	--	--	yes	2	2	--	--	--	Many stumps of varying ages and sizes
TEM_072	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_073	Ground	--	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_074	Ground	G	--	--	--	--	--	--	yes	2	2	--	--	--	Clean edge on stumps, indicates logging was relatively recent.
TEM_075	Ground	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_076	Ground	G	--	--	--	--	--	--	--	--	--	yes	2	2	Few old stumps
TEM_078	Ground	F	--	--	--	yes	2	3	--	--	--	--	--	--	--
TEM_081	Ground	F	--	--	--	--	--	--	--	--	--	yes	3	3	Plot is composed of plantation species
TEM_084	Ground	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_085	Oversample	E	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_086	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	No evidence of logging, but area looks to have been clear cut and planted in the past
TEM_088	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	This area would have been cleared for agriculture centuries ago and has been regularly disturbed by farming practices ever since.
TEM_091	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	No evidence of logging but area may have been selectively logged due to age of trees in polygon
TEM_094	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_097	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Evidence of logging in past (large, old stumps)
TEM_099	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	3	Appears to be logged 30+ years ago and replanted. Some evidence of logging i.e. stumps
TEM_101	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	No clear evidence of logging in plot. One nearby stump that appear very flat topped. Possible historic logging in polygon but likely mostly wind throw downing trees currently
TEM_102	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_103	Visual	P	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_104	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_106	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	2	Significant logging of large trees occurred likely ca. 100 yrs ago of very large diameter trees. Growth of the current tree species in this swamp is likely to be slow and composition has likely changed. Currently, trees are generally fairly small.
TEM_107	Visual	G	--	--	--	--	--	--	--	--	--	yes	3	3	Historically cleared, no remaining evidence of logging, currently a plantation
TEM_108	Visual	F	--	--	--	--	--	--	yes	2	2	--	--	--	Possible selective logging, some mature trees left. - huge cut stumps well rotted
TEM_110	Visual	F	--	--	--	--	--	--	yes	2	2	--	--	--	No stumps or skidder trails observed but stand age is young to mid-age and was presumably logged apps. 30 years ago..
TEM_111	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_114	Visual	G	--	--	--	--	--	--	--	--	--	yes	3	2	--
TEM_115	Visual	G	yes	1	1	--	--	--	--	--	--	--	--	--	Small number of cherry cut down within 5 years, stems left on ground. Previous harvesting ca. 15-30yrs ago is moderate, widespread.
TEM_116	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_119	Visual	G	yes	2	2	--	--	--	--	--	--	yes	2	2	Recent cut stumps & large wood piles provide evidence of recent logging. Old stumps show evidence of logging in past
TEM_121	Visual	G	--	--	--	--	--	--	yes	3	3	--	--	--	Likely clear cut and replanted 15-30 years ago (plantation). Regenerating now with some deciduous trees in sub canopy and scattered in canopy

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			Logging Field Notes
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	
TEM_122	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	No evidence of logging, but area is plantation so it was clear cut and planted in rows in the past trees were planted about 40 years ago according to landowner
TEM_123	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Agricultural for long time, regularly disturbed
TEM_126	Visual	F	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_127	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	No evidence but age and composition of trees suggest logging in the past
TEM_128	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	3	Likely historical logging evidence - stumps
TEM_133	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but area likely logged in past due to age of trees

TEM_193	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	Stumps present throughout plot
TEM_194	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	A few old rotting stumps but hard to tell for sure
TEM_198	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	3	No evidence but area was likely treed in past
TEM_200	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Some old rotting cut stumps. Area has mix of younger and more mature trees
TEM_201	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	1	Area on southern edge of plot previously cleared for agricultural drain - now a large swale dominated by Laportea
TEM_204	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_207	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Area is plantation, likely clear cut and replanted in past - landowner says trees were planted about 40 years ago
TEM_208	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Limited evidence of logging (a few stumps), but area presumed to have been logged due to age and composition of trees. Trails through polygon also indicate logging, but unknown age
TEM_209	Visual	F	--	--	--	yes	3	3	--	--	--	--	--	--	Landscape is quite mounded
TEM_210	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	Appears that there was selective logging
TEM_211	Visual	G	--	--	--	--	--	--	yes	2	2	--	--	--	--
TEM_212	Visual	F	--	--	--	yes	2	2	--	--	--	--	--	--	--
TEM_213	Visual	G	yes	1	1	--	--	--	--	--	--	yes	2	2	Stumps scattered across polygon, area likely selectively logged in past. Few logs more recently cut
TEM_215	Visual	F	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_217	Visual	F	--	--	--	yes	3	3	--	--	--	yes	3	1	--
TEM_218	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	No logging evidence, but area presumed to have been logged due to scarcity of trees
TEM_221	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_222	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of stumps, mid age to mature stand may suggest past logging many more than 30 years ago.
TEM_224	Visual	G	--	--	--	--	--	--	yes	2	1	yes	2	2	1 very old stump (30+ years), many newer (15-30 years) cut stumps in pockets. Many trees marked to be cut. Area likely logged in past due to age and composition on trees
TEM_225	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_226	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_227	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Area was probably clear cut long ago and planted with black walnut which are now 15-20 cm dbh with a high canopy. No stump evidence
TEM_228	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Old rotting stumps 30+ years old (seems to all be cut around the same time), large trees selectively marked for logging
TEM_230	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	Few large stumps
TEM_231	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_232	Visual	F	--	--	--	--	--	--	yes	1	1	yes	3	2	Selective logging more recent to remove dead/dying ash, clear cut 30+ years ago
TEM_233	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_234	Visual	F	--	--	--	--	--	--	--	--	--	yes	1	2	--

TEM_257	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	2	--
TEM_258	Visual	G	yes	3	1	--	--	--	yes	1	2	--	--	--	Some fresher cut trees for firewood. Some older moss-covered stumps scattered. Includes an area cleared for deer hunting. Cabin and hide within 50 m of plot.
TEM_259	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_260	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	Relatively young community overall with some larger trees scattered throughout
TEM_261	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Looks to have been selectively logged in the past - not old growth- but very little sign
TEM_262	Visual	G	--	--	--	yes	2	2	--	--	--	--	--	--	Cut stumps throughout, majority old, dead ash
TEM_263	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_264	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_265	Visual	P	--	--	--	--	--	--	--	--	--	yes	3	3	Area seems to have been completely logged in the past for pasture (no current evidence)
TEM_266	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	Old logging trails are growing in but ruts still present
TEM_267	Visual	--	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_268	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Rotting stumps visible
TEM_269	Visual	F	yes	2	2	--	--	--	--	--	--	--	--	--	Active logging occurring in plot
TEM_270	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	Few broken stumps may suggest selective logging historically
TEM_272	Visual	F	--	--	--	--	--	--	yes	1	1	--	--	--	Small scale logging has occurred in previous year
TEM_274	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_277	Visual	G	yes	1	1	--	--	--	--	--	--	yes	1	2	Recent cut log near hunting stand, no stump so possibly just cut to clear trail. No evidence of logging but area is too young to be old growth. There are a decent amount of more mature trees
TEM_278	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_279	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	--
TEM_280	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	No actual logging evidence but assumed to have been clear cut in the past
TEM_281	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_283	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_284	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Some cuts stumps. Area not old growth so logging is assumed to have happened. Relatively high proportion of mature trees
TEM_285	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	Stumps visible but very old in appearance, may be natural.
TEM_287	Visual	G	--	--	--	--	--	--	yes	2	2	--	--	--	A few old stumps, relatively young area
TEM_288	Visual	G	--	--	--	--	--	--	yes	2	2	--	--	--	No cut stumps but very young forest
TEM_290	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_291	Visual	G	--	--	--	yes	2	2	yes	2	2	--	--	--	Likely logged between 10-20 years ago.

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Logging Field Notes
TEM_292	Visual	F	yes	2	1	--	--	--	--	--	--	--	--	--	Active logging occurring on site
TEM_295	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	3	No evidence of logging but not old growth
TEM_296	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	2	No actual evidence of logging. Area looks to be approaching older growth - scattered white pine 50-70 cm dbh
TEM_297	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_298	Visual	F	--	--	--	yes	1	1	yes	2	2	--	--	--	Not much evidence of logging, but area very young with potential more recent selective logging in polygon
TEM_300	Visual	F	yes	2	3	--	--	--	--	--	--	--	--	--	Per landowner info logged in the last couple of years
TEM_301	Visual	F	--	--	--	yes	2	2	--	--	--	yes	1	1	Recent cut logs provide evidence for more recent logging. A few old cut stumps provide evidence of logging in past. Age and composition of trees indicate logging at both timeframes
TEM_304	Visual	F	yes	2	2	--	--	--	yes	2	3	--	--	--	Area seems to have been logged recently and in the past. Recent logging looks to have been focused on ash. Some older very large stumps (not yet rotted) may have been white pine
TEM_305	Visual	P	--	--	--	--	--	--	--	--	--	yes	3	3	Assumed to have been completely clear cut to make room for cattle
TEM_306	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging, but area presumed to have been logged due to age and composition of trees
TEM_310	Visual	G	--	--	--	--	--	--	yes	3	2	--	--	--	--
TEM_311	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Plantation must have been cleared at some point to be planted
TEM_312	Visual	G	yes	1	1	--	--	--	--	--	--	--	--	--	Small scale logging activities occurred
TEM_314	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_315	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging, but area presumed to have been logged due to age and composition of trees (thicket under plantation)
TEM_316	Visual	P	--	--	--	--	--	--	--	--	--	yes	3	3	Area looks to have been completely clear cut for pasture
TEM_318	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but area presumed to have been logged in past due to composition of trees - very widely spaced ash now dying off
TEM_319	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_320	Visual	F	yes	2	1	yes	2	1	--	--	--	--	--	--	--
TEM_321	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_322	Visual	F	--	--	--	yes	1	2	--	--	--	--	--	--	Actively managed plantation, evidence of cutting throughout
TEM_323	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	Few cut trees observed in polygon, older and decayed
TEM_325	Visual	F	yes	2	1	--	--	--	--	--	--	--	--	--	Ongoing logging
TEM_327	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but area likely logged in past due to young age of trees but also ash dead due to EAB and trees likely affected by periodic high water levels
TEM_328	Visual	F	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_329	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Likely clear cut in the past but younger than surrounding polygons
TEM_332	Visual	G	--	--	--	yes	2	2	--	--	--	--	--	--	--
TEM_333	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Few stumps scattered may be evidence of previous logging. Suggests selective cutting.
TEM_334	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	1	Land cleared for previous use (likely ayard or driveway)
TEM_335	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Very few signs of logging but trees fairly uniform age and medium age
TEM_337	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_338	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_339	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_340	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_341	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	A few large stumps, area likely logged in past due to age and composition of trees
TEM_343	Visual	F	yes	2	2	--	--	--	--	--	--	--	--	--	--
TEM_345	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Suspected clear cut and subsequent soil tilling.
TEM_346	Visual	F	yes	1	2	--	--	--	--	--	--	--	--	--	--
TEM_348	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Logging Field Notes

TEM_361	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Old conifer (likely cedar) stumps around plot - cut at 1 m height and 40-50 cm dbh
TEM_362	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_363	Visual	F	yes	2	2	--	--	--	--	--	--	--	--	--	Selective cutting.
TEM_364	Visual	G	--	--	--	yes	1	1	--	--	--	--	--	--	Ash removed due to EAB
TEM_365	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_366	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	No trees, would have been logged historically to clear swamp/forest for agriculture
TEM_368	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	Old stumps indicate potential logging in the past, hard to say for sure. Tree maturity also suggests logging in past
TEM_369	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Very large and old conifer (most likely cedar) stump in middle of plot
TEM_371	Visual	G	--	--	--	yes	2	2	--	--	--	--	--	--	--
TEM_374	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	A few old stumps here and there
TEM_375	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_376	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	2	Likely logged in past due to age of trees and species present (large trembling aspen are dominant and is successional)
TEM_377	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_378	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_379	Visual	F	--	--	--	yes	3	2	--	--	--	--	--	--	--
TEM_380	Visual	F	--	--	--	--	--	--	--	--	--	yes	2	3	Poplar age of 30-40years suggests logging occurred in 1980s/1990s.
TEM_381	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_383	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_384	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_385	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	A few old conifer stumps cut at about 1 m - some 50 m dbh
TEM_387	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_388	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_389	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_390	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_391	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	A few cut stumps. Area is not old growth so it presumably has been logged
TEM_393	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_394	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	>100 years
TEM_395	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_396	Visual	G	--	--	--	--	--	--	--	--	--	--	--	--	--
TEM_397	Visual	F	--	--	--	--	--	--	--	--	--	yes	3	3	Possible clear cutting due to early successional species: poplar, maple, cherry
TEM_399	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_400	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	No evidence of logging but are presumed to have been selectively cut in the past due to amount and age of trees

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Logging Field Notes
TEM_401	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but area likely logged in past
TEM_402	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but area is very immature, likely historic clearing
TEM_403	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_406	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	Scattered stumps
TEM_410	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_412	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Not much evidence of logging (1 old rotting cut stump), but area is not old growth
TEM_416	Visual	E	--	--	--	--	--	--	--	--	--	yes	3	3	Very old larger stumps, no damage from logging on existing trees
TEM_417	Visual	--	--	--	--	--	--	--	--	--	--	yes	1	2	Logging trail on the way to plot center, though no obvious signs in the plot. Trees are similar age. Below selection of skid trails are inside the ecosite, but not the polygon.
TEM_419	Visual	--	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_421	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	Likely maple and oak remanent species
TEM_422	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_423	Visual	E	--	--	--	--	--	--	--	--	--	yes	2	3	Some very old and rotten stumps that appeared cut
TEM_426	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_427	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence but area likely logged in past due to age and composition of trees
TEM_429	Visual	G	--	--	--	--	--	--	yes	1	2	--	--	--	Stumps observed
TEM_433	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	--
TEM_434	Visual	G	yes	1	1	--	--	--	--	--	--	yes	1	1	Evidence of recent cut trees, area likely cut 30+ years ago as well
TEM_436	Visual	G	--	--	--	--	--	--	yes	2	2	--	--	--	--
TEM_437	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_438	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_439	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_442	Visual	G	--	--	--	--	--	--	--	--	--	yes	3	2	--
TEM_443	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_444	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_445	Visual	P	yes	3	3	--	--	--	--	--	--	--	--	--	Area completely clear cut recently, dead ash removed (EAB)
TEM_446	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Very young trees but no signs of logging
TEM_447	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	1	Active logging occurring during sampling
TEM_450	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No stumps but canopy trees are Mid-aged with some early successional poplar suggesting logging
TEM_451	Visual	F	--	--	--	--	--	--	yes	3	2	yes	3	2	Logging 15-30 years ago has created a very dense sub canopy of multi-stemmed young maple (5-15 cm dbh). Abundant small branches on ground but no ruts so not too recent? Large and small stems arise from same stump so high water levels may also have killed trees in some years (seems more likely than successive cuts); Very large stumps show logging from 30+ years ago, area likely clear cut
TEM_452	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Selective logging occurred over 30 years ago
TEM_453	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but not old growth
TEM_454	Visual	F	--	--	--	yes	2	2	--	--	--	--	--	--	Evidence of logging from quite a while ago but also recently.
TEM_455	Visual	E	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_456	Visual	G	yes	2	2	--	--	--	--	--	--	--	--	--	--
TEM_458	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	1	--
TEM_460	Visual	--	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_461	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_462	Visual	G	--	--	--	--	--	--	yes	3	2	--	--	--	--
TEM_463	Visual	G	yes	1	1	--	--	--	--	--	--	--	--	--	active logging occurring on site, light logging activity
TEM_465	Visual	G	--	--	--	yes	1	1	--	--	--	yes	1	2	Some downed trees cut more recently (5-15 years). Limited logging evidence but area presumed to have been logged in past due to age of trees. Many dead ash marked to be logged

Site ID	Survey Type	Overall Condition[1]	0-5 years			5-15 years			15-30 years			30 or more years			
			Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Evidence?	Intensity	Extent	Logging Field Notes
TEM_466	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No visible evidence of logging aside from mid age stand and general logging history within Greenock Swamp.
TEM_468	Visual	F	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_469	Visual	G	yes	1	1	--	--	--	yes	2	2	--	--	--	Evidence of recent logging locally, but area was likely clear cut in the past. Most trees mid aged to young.
TEM_470	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	No evidence of logging but not old growth
TEM_471	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_472	Visual	G	--	--	--	--	--	--	--	--	--	yes	2	2	Old stumps likely from logging in past. Trees relatively young, also suggest logging in past
TEM_473	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	--
TEM_474	Visual	G	--	--	--	--	--	--	--	--	--	yes	1	2	Evidence of logging; some forestry marks on trees and a few stumps

Notes:
1. Overall Condition Codes: E = Excellent; G = Good; F = Fair; P = Poor.

Notes:
Overall Condition Codes: E = Excellent; G = Good; F = Fair; P = Poor
Ev. = Evidence; Int. = Intensity; Ext. = Extent.

Table E-4. Evidence of natural disturbance recorded in plots surveyed within the BIS study areas.

Chapter Table of Contents

List of Appendices

List of Tables

List of Appendix Figures

List of Appendix Tables

Glossary and Abbreviations

AHM	Aquatic Habitat Mapping
ANSI	Area of Natural and Scientific Interest
AOI	Area of Interest
BIS	Biodiversity Impact Studies
BPPA	Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach
BV	Biodiversity Value. The biotic environmental components that will be considered for study within the Project's Biodiversity Impact Studies. A subset of biodiversity values will ultimately be scoped into the Biodiversity Impact Assessment as Valued Components.
dbh	Diameter at breast height
Ecodistrict	Third highest level of the ELC hierarchy (Crins et al. 2009). Subdivisions of an ecoregion, primarily identified by patterns of relief, geology, geomorphology, and substrate parent material.
Ecoelement	Lowest level of the ELC hierarchy (Crins et al. 2009). Specific occurrences of vegetation and substrate types.
Ecoregion	Second highest level of the ELC hierarchy (Crins et al. 2009). Large geographic areas primarily identified by sub-continental climatic regimes and bedrock geology.
Ecosite	Second lowest level of the ELC hierarchy (Crins et al. 2009). The land within an ecosite will generally contain similar substrate and vegetation.
Ecosite classification dataset	The dataset of ecosite classification created for the BIS using SWOOP 2020 imagery.
ECS	Ecoregional Criterion Schedule
eDNA	Environmental DNA
ELC	Ecological Land Classification
EO	Element Occurrence. An EO is an area of land and/or water where a species or vegetation community is or was present. EOs represent areas important to the conservation of a species or vegetation community. In Ontario, the NHIC generates each EO from one or more observations, based on international standard EO specifications developed by NatureServe (NDMNRF 2021).
ESA	Ontario *Endangered Species Act*
GBIF	Global Biodiversity Information Facility
GIS	Geographic Information System
GLSE	Great Lakes Shoreline Ecosystem
GSWC	Greenock Swamp Wetland Complex
IA	Impact Assessment

Lek	A communal area where animals congregate during the breeding season and males engage in competitive displays and courtship rituals to attract females. A variety of species use a lek mating system; grouse are amongst the most well-known examples.
LSA	Local Study Area LSA_{TER} = Terrestrial Local Study Area LSA_{AQU} = Aquatic Local Study Area LSA_{ECO} = combined LSA_{TER} and LSA_{AQU} for studying ecosystem function and services
MNRF	Ontario Ministry of Natural Resources and Forestry
NBCP	Native Bat Conservation Program
NHIC	Ontario Natural Heritage Information Centre
NWMO	Nuclear Waste Management Organization
PPS	Ontario Provincial Policy Statement (under the *Planning Act*)
Project	The Adaptive Phased Management Project is the Deep Geological Repository and other required infrastructure for the safe, long-term management of Canada's used nuclear fuel.
QA/QC	Quality Assurance/Quality Control
Restricted Element	Restricted elements are species, plant communities, or wildlife concentration areas that are at high risk of exploitation, are sensitive to disturbances, and/or could be harmed if data are not appropriately protected.
Rights-holders	First Nation and Métis communities who have asserted and or hold recognized treaty and/or Indigenous rights and whose Traditional Territories include the project location.
RSA	Regional Study Area RSA_{AVI} = Regional Study Area for Terrestrial Avifauna $RSA_{AVI-AQU}$ = Regional Study Area for Aquatic and Semi-aquatic Avifauna RSA_{BAT} = Regional Study Area for Bats RSA_{ECO} = Regional Study Area for Ecosystem Function and Services RSA_{HRP} = Regional Study Area for Terrestrial Herpetofauna $RSA_{HRP-AQU}$ = Regional Study Area for Aquatic and Semi-aquatic Herpetofauna RSA_{UNG} = Regional Study Area for Ungulates RSA_{VEG} = Regional Study Area for Vegetation
SAR	Species at Risk
SON	Saugeen Ojibway Nation
SON-South Bruce siting area	Used to describe the broader area surrounding the defined area within which the Project may be located. The SON-South Bruce siting area is the general area surrounding the Municipality of South Bruce and includes the traditional territory of Saugeen Ojibway Nation (SON) in southwestern Ontario.
Species of conservation concern	Includes provincially and/or federally listed SAR (Extirpated, Endangered, Threatened, Special Concern) and provincially rare (SRANK S1, S2, S3, SH) species. Regionally rare species may also be scoped in if identified by stakeholders and/or rights-holders as Valued Components.

Species of interest	Includes species of conservation concern, culturally important species, indicator species, and invasive species (where applicable).
SRANK	Subnational Rank. SRANK is the conservation status of a species or vegetation community within a particular province, territory, or state. In Ontario, the NHIC assigns SRANKs using the best available information and considering factors such as abundance, distribution, population trends, and trends (NDMNRF 2021). Species assigned S1 (Critically Imperiled), S2 (Imperiled), S3 (Vulnerable), and SH (Possibly Extirpated) are considered provincially rare by the NHIC. See the NatureServe website for more information: https://www.natureserve.org/nsexplorer/about-the-data/statuses/conservation-status-categories
SWH	Significant Wildlife Habitat Defined in the Ontario Provincial Policy Statement, 2020 as: *Wildlife habitat* – areas where plants, animals and other organisms live, and find adequate amounts of food, water, shelter and space needed to sustain their populations. Specific wildlife habitats of concern may include areas where species concentrate at a vulnerable point in their annual life cycle; and areas which are important to migratory and non-migratory species. *Significant* – in regard to wildlife habitat, ecologically important in terms of features, functions, representation or amount, and contributing to the quality and diversity of an identifiable geographic area or natural heritage system. Candidate SWH are areas that meet the ELC ecosite code(s) and/or habitat criteria outlined in the SWH ecoregional criterion schedule (ECS). Confirmed SWH are areas that meet the defining criteria outlined in the SWH ECS. Detailed field investigations are usually needed to confirm SWH.
SWHMiST	Significant Wildlife Habitat Mitigation Support Tool
TEM	Terrestrial Ecosystem Mapping

1.0 BACKGROUND

Significant Wildlife Habitat (SWH) is defined in the Ontario Provincial Policy Statement (PPS) (MMAH 2020) under the *Planning Act* as:

- *Wildlife habitat* – areas where plants, animals and other organisms live, and find adequate amounts of food, water, shelter and space needed to sustain their populations. Specific wildlife habitats of concern may include areas where species concentrate at a vulnerable point in their annual life cycle; and areas which are important to migratory and non-migratory species.
- *Significant* – in regard to wildlife habitat, ecologically important in terms of features, functions, representation or amount, and contributing to the quality and diversity of an identifiable geographic area or natural heritage system.

The Ontario Ministry of Natural Resources and Forestry (MNRF) has developed the *Significant Wildlife Habitat Technical Guide* (OMNR 2000) and Significant Wildlife Habitat Criteria Schedules for select ecoregions, including Ecoregion 6E, within which the Saugeen Ojibway Nation (SON)-South Bruce siting area is located (OMNRF 2015). These documents are intended to assist ecologists, biologists, environmental planners, and others involved in planning and development processes in the identification, evaluation, and ranking (i.e., prioritization) of SWH. The SWH technical guide and criteria schedules describe the criteria required for the identification of candidate SWH and confirmed SWH. Candidate SWH refers to habitat that meets the criteria outlined in the specific SWH Ecoregional Criterion Schedule (ECS), as determined through desk-based work and/or field verification. Confirmed SWH refers to candidate SWH that has been field verified and confirmed to contain the biota and defining criteria contained within the specific SWH ECS. Confirmed SWH may then become legally protected by the Ontario PPS under the provincial *Planning Act*.[1]

The 6E ECS (Ecoregion 6E – Ecoregional Criterion Schedule) includes 39 types of SWH, including 15 seasonal concentration areas, seven rare vegetation communities, eight specialized habitats for wildlife, five habitats for species of conservation concern, two animal movement corridors, and two exceptions for Ecoregion 6E (OMNRF 2015):

1. Seasonal Concentration Areas
    a. Waterfowl Stopover and Staging Areas (Terrestrial)
    b. Waterfowl Stopover and Staging Areas (Aquatic)
    c. Shorebird Migratory Stopover Area
    d. Raptor Wintering Area
    e. Bat Hibernacula
    f. Bat Maternity Colonies
    g. Turtle Wintering Areas
    h. Reptile Hibernaculum
    i. Colonially-Nesting Bird Breeding Habitat (Bank and Cliff)

[1] The BIS Program is focused on potential impacts (including benefits) to biodiversity values (BVs) and supporting their conservation (e.g., where legal protection of SWH would be considered a benefit to biodiversity). However, Zoetica acknowledges that, for the impact assessment (IA), potentially competing interests between environment, social, and economic pillars, particularly involving values of land uses, will need to be managed using a holistic and dialogue-driven approach.

   j. Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs)
   k. Colonially-Nesting Bird Breeding Habitat (Ground)
   l. Migratory Butterfly Stopover Areas
   m. Landbird Migratory Stopover Areas
   n. Deer Yarding Areas
   o. Deer Winter Congregation Areas
2. Rare Vegetation Communities
   a. Cliffs and Talus Slopes
   b. Sand Barren
   c. Alvar
   d. Old Growth Forest
   e. Savannah
   f. Tallgrass Prairie
   g. Other Rare Vegetation Communities (see Appendix M in (OMNR 2000))
3. Specialized Habitat for Wildlife
   a. Waterfowl Nesting Area
   b. Bald Eagle and Osprey Nesting, Foraging, and Perching Habitat
   c. Woodland Raptor Nesting Habitat
   d. Turtle Nesting Areas
   e. Seeps and Springs
   f. Amphibian Breeding Habitat (Woodland)
   g. Amphibian Breeding Habitat (Wetlands)
   h. Woodland Area-Sensitive Bird Breeding Habitat
4. Habitat for Species of Conservation Concern (Not including Endangered or Threatened Species)
   a. Marsh Bird Breeding Habitat
   b. Open Country Bird Breeding Habitat
   c. Shrub/Early Successional Bird Breeding Habitat
   d. Terrestrial Crayfish
   e. Special Concern and Rare Wildlife Species
5. Animal Movement Corridors
   a. Amphibian Movement Corridors
   b. Deer Movement Corridors
6. Exceptions for Ecoregion 6E
   a. Ecodistrict 6E-14 – Mast Producing Areas
   b. Ecodistrict 6E-17 – Lek

Upon examination, four of these SWH types are not relevant to the Adaptive Phased Management Project (hereafter, 'the Project') in the SON-South Bruce siting area. To be considered as Migratory Butterfly Stopover Areas and Landbird Migratory Stopover Areas, habitats need to be located within 5 km of Lake Ontario (OMNRF 2015). Even the boundary of the greatest extent of the Biodiversity Impact Studies (BIS) study areas – the Regional Study Area (RSA) for ecosystem functions and services (RSA_{ECO}), which encompasses the RSAs for upland breeding birds and terrestrial invertebrates – is approximately 130 km from Lake Ontario. The two SWH exceptions for Ecoregion 6E (Mast Producing Areas and Lek) are also restricted to ecodistricts outside of the BIS study areas (Wester et al. 2018). The Tobermory Ecodistrict (6E-14), located at the northern end of the Bruce Peninsula, supports an isolated and distinct population

of American black bears, which rely on mast-producing trees for food in the summer and fall. The Manitoulin Ecodistrict (6E-17) includes Manitoulin Island, the only area in Ecoregion 6E where sharp-tailed grouse occur. This species uses traditional lekking sites for courtship displays. The RSA_{ECO} is located primarily within the Mount Forest Ecodistrict (6E-5) and partly within the Kincardine (6E-2) and Stratford (6E-1) ecodistricts (**Figure A-1**), south of Ecodistricts 6E-14 and 6E-17.

There may be other SWH types that are unlikely to be relevant to the SON-South Bruce siting area, such as certain rare vegetation communities that are more common in the Bruce Peninsula (e.g., Alvars), the shoreline of Lake Huron (e.g., Freshwater Coastal Dunes, included as "Other Rare Vegetation Communities"), or the Niagara Escarpment (e.g., Cliffs and Talus Slopes) within Ecoregion 6E. However, to be conservative, Zoetica™ considered the remaining 35 types of SWH during desk-based investigations of ecosites, indicator/characteristic and selected wildlife species, and other habitat features within the BIS study areas (see Section 2.0).

1.1 Objectives

The overall objectives of SWH identification for the BIS are to:

1. Identify potentially important habitats (i.e., candidate SWH) within the Area of Interest (AOI) and biodiversity value (BV)-specific local study areas (LSAs) and regional study areas (RSAs), which will assist in the selection of survey locations for more detailed Tier 2 studies, including confirmation of SWH.
2. Characterize the presence and distribution of candidate and confirmed SWH for relevant species, including species of interest (e.g., at-risk, rare, culturally important, and indicator species), within the BV-specific study areas.
3. Delineate and map candidate and confirmed SWH (including sensitivity buffers), to inform mitigation during project planning (e.g., site alignment), construction, and operations, in compliance with the Ontario PPS.
4. Provide baseline data to help inform the Project's biodiversity impact assessment (IA) and mitigation measures, and to assist in the potential development of monitoring program(s) to address environmental, regulatory, and stakeholder/rights-holder concerns.

Applying the MNRF approach of identifying SWH will capture potential significant habitat in various seasons for both at-risk and not-at-risk wildlife species (OMNRF 2015). The identification of important breeding, migration/stopover, and wintering habitats will be crucial for the Project's biodiversity IA and may also contribute to research and recovery efforts for species at risk (SAR). Zoetica can then use maps of potentially suitable habitats to direct targeted field reconnaissance surveys to confirm habitat quality for target species/species groups. Furthermore, if additional habitat suitability mapping is needed to improve the understanding of the availability and quality of habitat on the landscape for certain species, mapped SWH can be used as a starting point. Mapping SWH can also help evaluate the availability, spatial arrangement, uniqueness (compared to a regional context), and quality of habitat that could be directly or indirectly affected by the Project.

1.2 Best Practices

The general approach for identification of candidate SWH in Ontario involves first comparing species' habitat descriptions to land cover data (e.g., ecosites). Appendix G in the *Significant Wildlife Habitat Technical Guide* presents habitat matrices for all native vertebrate (amphibians, reptiles, birds, mammals)

and vascular vegetation species in Ontario (OMNR 2000). The matrices include habitat/behaviour descriptions and general habitat features associated with each species, such as wetlands, open water, riparian areas, grasslands, parklands/suburban areas, thickets and second growth, old growth and mature stands, forest edges, downed woody debris, seeps, and cliffs, talus slopes, and ravines. Dialogue with Indigenous Knowledge holders and knowledgeable stakeholders can also help to identify areas for ground-truthing. Examples of such groups include the MNRF district office, local Conservation Authorities, field naturalist clubs and landowners, municipalities, and Environment and Climate Change Canada.

Field-based surveys are then conducted to verify candidate SWH identified through desktop studies. Additional habitat criteria for the SWH need to be considered on the ground – some landscape features may be identified through desktop analysis of existing data, while other criteria will likely only be verified through field observations. Field studies are also generally needed to confirm SWH, such as by documenting the presence of target species and evidence of habitat use.

Notes: the *Significant Wildlife Habitat Technical Guide* and 6E ECS focus on terrestrial and wetland habitats for terrestrial and semi-aquatic animals and vegetation, while a separate provision exists in the Ontario PPS for the protection of fish habitat (MMAH 2020). However, important habitats for Special Concern and Rare fish species could also be interpreted as SWH. As the modernized *Fisheries Act* (last amended on 28 August 2019) protects all fish and fish habitat in Canada, this federal legislation would also protect SWH for fish. For the purposes of the BIS and to avoid redundancy in reporting on regulatory requirements, fish habitat will be discussed separately from SWH unless the *Fisheries Act* is amended again in the future to become less protective of fish habitat. Refer to the BIS Baseline sections on Aquatic Habitat Mapping (Appendix D, Chapter 1) and Fish and Fish Habitat (Chapter 8) for further details about fish habitat.

2.0 STUDY AREAS

Identification and mapping of each SWH type will occur within the relevant BV-specific study areas. See Section 3.0 in Chapter 1 of the 2023 BIS Baseline Report and Section 5.2 of Zoetica's *Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach* (BPPA) Report for more details on study area descriptions (Zoetica 2021a).

For the Tier 1 baseline studies, desk-based ecosite classification and subsequent field verification were completed as part of Terrestrial Ecosystem Mapping (TEM) (see Appendix B, Chapter 1), and only covered the LSA for ecosystem functions and services (LSA_{ECO}). A map of the LSA_{ECO} and general project area, including various landscape features for reference, is available in **Figure A-2** in Appendix A. The LSA_{ECO} encompasses both the terrestrial LSA (LSA_{TER}) and aquatic LSA (LSA_{AQU}) and overlaps portions of the BV-specific RSAs. Zoetica analyzed ecosite data to identify candidate SWH for the LSA_{ECO}. However, important wildlife habitats tracked by the MNRF and relevant species observations collated from both desk- and field-based data were mapped to the BV-specific RSAs to allow for interpretation with ecosite data.

If the SON-South Bruce siting area is selected for the Project, Zoetica will expand baseline data collection for the ecosite classification dataset to the RSA for studies of vegetation (RSA_{VEG}) and complete additional ecosite analyses for candidate SWH. When the ecosite classification dataset is complete, field identification of SWH will also be expanded into the BV-specific RSAs in future years of the baseline program.

3.0 METHODS

A full list of species mentioned in this report, including common and scientific names, is available in **Table B-1** in Appendix B.

3.1 Desk-based Mapping of Candidate SWH

Zoetica documented and mapped SWH that was already identified by MNRF (e.g., from the Wildlife Activity datasets; see **Table C-1**) or encountered in the field. For the most part, candidate and confirmed SWH are not tracked in a central database by the Government of Ontario. However, the MNRF and Natural Heritage Information Centre (NHIC) manage wildlife and wildlife habitat data layers that may constitute SWH. Citizen science databases and other biodiversity databases (e.g., Global Biodiversity Information Facility [GBIF]) may contain observations that warrant further study as candidate SWH. Zoetica also investigated findings from the previous 2020 preliminary environmental studies conducted for the Project in the SON-South Bruce siting area (Tulloch Environmental 2020, 2021) and current research from the Nuclear Waste Management Organization's (NWMO) partnership with the Toronto Zoo's Native Bat Conservation Program (NBCP). While Tulloch Environmental's survey efforts do not fully coincide with the current BIS study areas, relevant data can be gleaned from their reports. The databases, data layers, and reports investigated and analyzed for the 2023 SWH baseline report are presented in **Table C-1** in Appendix C. See also Appendix A, Chapter 1 for data quality scoring.

Zoetica began desk-based identification and mapping of candidate SWH with analysis of the Ecological Land Classification (ELC) ecosites listed in the 6E ECS (OMNRF 2015). The 6E ECS references ecosites from the 1998 "first approximation" ELC system for southern Ontario (hereafter, 'ELC-1998') (Lee et al. 1998). However, the ecosite classification dataset created for the BIS used the updated draft Great Lakes Shoreline Ecosystem (GLSE) classification system (Lee et al. 2021a) (see Appendix B, Chapter 1). To support SWH analyses, Zoetica converted the GLSE assignments to the ELC-1998 system using the draft ecosite conversion tables in Lee et al. (2021b). For GLSE ecosites with no equivalent ELC-1998 code(s) in the conversion tables, one Zoetica staff member manually reviewed the vegetation types/characteristics and selected the closest ELC-1998 match, while a second staff member independently verified the conversion by repeating this process. This manual review resulted in conversions primarily at the ecosite level; however, some assignments were refined to ELC vegetation type, while others could only be resolved to the ELC community series or community class (see **Table C-2**). In addition, the ecosite classification dataset included only natural and naturalized habitats; therefore, the potential for some agricultural fields to be candidate SWH (e.g., depending on activity and crop type) could not be ascertained through desk-based analyses.

For some rare vegetation communities, such as Cliffs and Talus Slopes and Sand Barren, the ecosites listed in the 6E ECS can be directly considered strong candidate SWH. These ecosites will likely require only field investigations to confirm vegetation composition and area size to become confirmed SWH (OMNRF 2015). For other SWH types, listed ecosites (or ELC community series or community class) indicate where the habitat feature is more likely to be found. However, certain SWH types may still occur in a wide variety of habitats (e.g., "all forested ecosites") and more intensive desk- and field-based investigations are needed to confirm SWH. Where possible, Zoetica conducted additional GIS analyses using the specified habitat criteria noted in the 6E ECS, such as requirements for proximity to watercourses/waterbodies, adjacent habitats, and minimum patch size, to refine the locations of candidate SWH beyond ecosite matches. Zoetica used a conservative approach and included contiguous ecosite polygons to calculate minimum

area sizes; and considered line features (e.g., roads, trails, watercourses) that separate suitable polygons as 'breaks' to the habitat patch. However, the ecological importance of these features – i.e., whether they would be considered as disrupting the sense of continuous habitat – may depend on the BV (e.g., smaller upland breeding birds may be less tolerant than larger raptors).

The habitats of species of Special Concern (under the Ontario *Endangered Species Act* [*ESA*]) and provincially rare wildlife and vegetation species (subnational rank [SRANK] S1, S2, and S3) are also considered SWH after Element Occurrences (EOs) generated by the NHIC (which are considered candidate SWH) are spatially refined to the ecosite level through detailed field studies. Furthermore, the 6E ECS and *Significant Wildlife Habitat Technical Guide* provide lists of indicator vegetation species to identify certain rare vegetation communities, and the 6E ECS and *Significant Wildlife Habitat Mitigation Support Tool* (SWHMiST) (MNRF 2014) also list wildlife species of relevance for each SWH type. Thus, Zoetica investigated the data sources shown in **Table C-1** to collate records of at-risk[2], provincially rare, and other SWH-relevant species within the BIS study areas. See Appendix A, Chapter 1 for data quality scoring.

3.2 Field Identification of Candidate SWH

Tulloch Environmental was retained as the field data collection contractor to complete the first year of Tier 1 terrestrial studies (TEM and Identification of Candidate SWH). Tulloch Environmental conducted field studies in the summer of 2022 between July 18 and September 29, with assistance from four field subcontractors: Natural Resource Solutions Inc., North-South Environmental Inc., Stantec, and SLR Consulting. Each survey crew consisted of a wildlife biologist who identified candidate SWH, and a vegetation specialist and a soil specialist who ground-truthed the ecosite mapping.

Candidate SWH were surveyed ***opportunistically***[3] at 473 out of 474 TEM plots visited (full, ground, and visual). Zoetica originally designed the TEM/SWH studies to include 538 survey sites (Zoetica 2022). See Section 3.2 of Appendix B, Chapter 1, for further details regarding TEM study design and survey site selection. However, the field data collection contractor encountered access limitations on the ground (e.g., private land restrictions, unsafe conditions, unobtained utility locates), which resulted in the omission of 66 plots.

Surveys were focused on field-based identification of potential wildlife breeding habitats, permanent features, and other candidate SWH that are identifiable through vegetation communities and characteristics within natural/naturalized ecosites. Incidental field observations of relevant wildlife species and habitat use were also recorded to support candidate SWH identification. The wildlife biologist recorded the presence, absence, or unknown status (i.e., due to unmet seasonal requirements) of candidate SWH, following the habitat criteria outlined in the 6E ECS (OMNRF 2015). Ecosite criteria were

[2] For the purposes of this 2023 Tier 1 BIS Baseline Report, conservation statuses described in text for at-risk species refer to their Species at Risk in Ontario (SARO) listings unless otherwise indicated. Conservation statuses are from the NHIC's Ontario species list, current to March 1, 2023, and updated for any discrepancies with provincial and federal SAR listings up to August 15, 2023. As such, species and status listings may differ from those presented in Zoetica's 2021 BPPA Report (Zoetica 2021a).

[3] Zoetica acknowledges that opportunistic summer surveys at TEM plots will not capture all potentially occurring candidate SWH types listed in the 6E ECS. Therefore, Zoetica proposes additional seasonal surveys of candidate SWH within targeted areas corresponding to BV-specific study areas as part of Tier 2 studies. See Section 5.3 for further information.

not included in the scope of field work due to the complication of converting the pre-determined GLSE codes to the ELC-1998 codes listed in the 6E ECS. Rather, Zoetica completed *post hoc* ecosite analyses for SWH after the field-derived TEM data were completed, quality-checked, and transferred according to NWMO policies and procedures.

Where one or more habitat criteria were met, field teams were instructed to provide habitat details and rationale for determining that a plot contains, potentially contains (i.e., requires a more detailed survey at an appropriate time of year to confirm), or does not contain candidate SWH.[4] Site photographs were taken as additional documentation of the habitat characteristics and incidental observations. Please refer to the Standard Operating Procedure for TEM and Identification of Candidate SWH in the *Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design Report* (Zoetica 2022) for more details on the field procedures.

Tier 1 aquatic studies (Aquatic Habitat Mapping and eDNA metabarcoding) also began in the summer of 2022, with a second eDNA field campaign completed in the fall of 2022 (see Appendix D and Appendix E, Chapter 1). While these aquatic studies are not directly related to identification of candidate SWH, certain species observations and habitat assessments may provide supporting information for further study. In addition, field crews for all Tier 1 BIS baseline programs were instructed to record incidental wildlife and vegetation observations, including whether the observation is a potential indicator of SWH, at their survey plots and while traversing through the BIS study areas.

3.2.1 Data QA/QC

The field data collection contractor completed quality assurance and quality control (QA/QC) of their 2022 field data prior to submitting the dataset to the NWMO, who then provided the dataset to Zoetica for data analysis and interpretation. Data received by Zoetica were assumed to be in a cleaned, error-free, useable format. Data ambiguities, such as uncertain species identifications, were resolved between Zoetica and Tulloch Environmental prior to finalizing this SWH appendix. Further details on the field program timeline, training, sampling/surveying, project tracking, data QA/QC, internal audits, and a summary of quality issues encountered can be supplied by the NWMO upon request. Aside from the number of planned versus completed plots (described in Section 3.2), the only discrepancy between Tulloch Environmental's work plan and work conducted was the need for extensive *post hoc* data QC, rather than ongoing quality checks as the field season progressed, due to issues encountered with the digital field form and database. The NWMO, Zoetica, and the field data collection contractor will continue to discuss opportunities for improvement for future BIS baseline study design and field planning.

3.3 Species Observations Mapping and Interpretation

To protect sensitive species and ecosystems, NHIC spatial data and 2022 field data pertaining to provincially tracked (at-risk and rare) species and wildlife concentration areas (e.g., nest colonies) are represented by a 1 km grid, rather than a point or polygon, as per the NHIC's Sensitive Data Location Standards (NHIC n.d.). Descriptive reporting also follows sensitivity standards and is not detailed enough to allow for precise geolocation. In addition, data for NHIC Restricted Elements, such as Endangered bat species, are further protected by not presenting these data on maps, describing observations to the

[4] Where additional habitat details and rationale were not provided, it is assumed that the plot meets (or did not meet) the 6E ECS habitat criteria. The field data collection contractor and their subcontracted wildlife biologists are experienced and knowledgeable in the identification and evaluation of SWH in southwestern Ontario.

largest relevant BIS study area, and obscuring species names to "Restricted Species" with an alphanumeric code.

GBIF data were limited to observations from 1970 onward as older observations were considered historic and not as reliable. For wildlife species, mapping was restricted to the appropriate seasonal timing window(s) for the SWH type (see **Table C-3**). When there were multiple entries with a count of one at the same location, Zoetica assumed the entries were all the same individual to avoid double-counting and erroneously reporting that multiple individuals were present. As observations of multiple individuals are more relevant for identifying candidate SWH, group observations are further described in Section 4.0 of this SWH appendix.

Zoetica screened all incidental field observations for relevance to SWH mapping and discussion in the Results, Section 4.0, below. Observations were mapped without consideration of seasonal timing windows (see **Table C-3**) if they were 1) recorded by TEM/SWH survey crews as part of the habitat details and rationale for identifying candidate SWH, 2) recorded on the separate incidental observations data form and marked as a potential indicator of SWH, 3) Special Concern and Rare species, or 4) identified by Zoetica as potentially relevant to SWH (e.g., nesting/breeding habitats or activities, presence of young/juveniles, groups of wildlife). Other incidental species observations without additional context for SWH were filtered by the seasonal timing windows. Evidence of species habitat use (e.g., nesting) is more relevant for identifying candidate SWH than general observations of the species occurring in the area (but not using the habitat). However, the presence of SWH representative species within the BIS study areas, especially during appropriate times of the year for seasonal SWH types, may provide further support for continuing investigations of SWH.

Incidental observations were recorded during various Tier 1 baseline field programs and were noted on different data forms. Incidental observations varied in method of observation (audio, visual, etc.) and life history stage of organisms, and may have been recorded in transit to a site and thus not associated with habitat data. As well, expertise in species identification may have varied among field contractors working on different field programs. Thus, not all pertinent information may have been available (e.g., observation type, activity, demographics) or collected in a directly comparable manner (e.g., quantity).

For SWH mapping and interpretation purposes, Zoetica defaulted to 'unspecified' observation type, count of one individual, and adult organisms unless otherwise indicated. Observation types of particular relevance to candidate SWH, such as nests, eggs and young, burrows, potential breeding habitat, potential hibernacula, and other evidence of breeding, were directly reported. In contrast, Zoetica created a general "wildlife sign" observation type to encompass observations of tracks, scat, evidence of feeding (e.g., deer browse, sapsucker holes), body parts (e.g., feathers, antlers, snakeskin, carcasses), etc., that are less informative for identifying candidate SWH. Zoetica also simplified the variable quantity data from field incidental observations in 2022: numerical counts and densities (low, medium, high) were directly reported, whereas qualitative descriptions were categorized into "many", "multiple", and "several"[5]. Zoetica also assumed one individual when a singular observation (e.g., "frog") was recorded in the field notes, and more than one individual if plural observations (e.g., "frogs") were recorded.

[5] Zoetica's categorization of "many" individuals includes field incidental observation entries of "many", "large amount", "large number", "lots", and "numerous" individuals. The categories of "multiple" and "several" individuals include only entries with "multiple" and "several" individuals, respectively.

For both desk- and field-based species observation data, only the species and locations (masked for sensitive data, where needed) are presented on the maps in Appendix D. Additional information about count, observation type, and source type (i.e., which Tier 1 program the incidental observation came from) is presented in the supplemental table(s) for each map in Appendix D.

4.0 RESULTS

For this 2023 BIS Baseline Report, Zoetica produced candidate ecosite SWH mapping by updating the remotely sensed ecosite classification dataset (i.e., desk-based TEM) using the ground-truthed ecosite data (i.e., field-based TEM). Candidate SWH mapping also included field plot determinations of whether the habitat met additional criteria as outlined in the 6E ECS, and both desk- and field-based observations of relevant wildlife species.

A summary of confirmed and candidate SWH identified within the AOI and BV-specific LSAs and RSAs is presented in **Table 4-1**. Confirmed SWH includes Deer Winter Congregation Areas, Seeps and Springs, Terrestrial Crayfish, and nesting habitat for barn swallow (Special Concern). Additionally, there are 23 SWH types where candidate SWH was considered present due to ecosite matches, some or all habitat criteria being met, or records of species and/or habitat features. The following Sections 4.1 through 4.5 describe the combined desk- and field-based results for each SWH type of relevance in the SON-South Bruce siting area. All map figures showing candidate SWH and supplemental tables for observation data are presented in Appendix D. A summary of GLSE ecosite matches for each SWH type is presented in **Table E-1** in Appendix E.

Notes:

1. For the purposes of this table, the indicated study area excludes overlap with other study area(s) that may be encompassed within its boundaries.
2. "?" refers to TEM plots where surveyors marked the presence of candidate SWH as "unknown".
3. See Table C-1 and References for full names of datasets and sources used in this analysis.
4. For Colonially-Nesting Bird Breeding Habitat (Ground), ecosite matches and field-identified candidate SWH plots apply to Brewer's blackbird only. There have been no observations of Brewer's blackbird within the BIS study areas. There are GBIF records for gulls and terns but information about potential nesting was not available. See Section 4.1.11 for further discussion of this SWH type.
5. Observations for Old Growth Forest refer to nesting bird species described as indicators/representatives of, or associated with, old growth forests (MNRF 2014). The presence of these birds may help identify candidate SWH; however, confirmation of Old Growth Forest requires direct assessment of forest characteristics. See Section 4.2.4 for further discussion of this SWH type.

4.1 Seasonal Concentration Areas

4.1.1 Waterfowl Stopover and Staging Areas (Terrestrial)

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 59 meadow and three shrub ecosites that matched 6E ECS criteria (**Figure D-1**, **Table E-1**).

Of the 473 TEM plots assessed in the field, none were identified as candidate SWH, five (1.1%) were assigned as "unknown", and the remaining 468 (98.9%) were not considered suitable Waterfowl Stopover and Staging Areas (Terrestrial) (**Figure D-1**). The five "unknown" plots – one in the AOI, two in the LSA_{TER} outside the AOI, and two in the $RSA_{AVI-AQU}$ south of the LSA_{TER} – were marked as such because these areas were surveyed in the summer but have the potential to flood in the spring and provide important invertebrate foraging habitat for migrating waterfowl. Similarly, the few field observations of waterfowl were not considered relevant to this SWH type due to the summer survey timing.

However, notable migration observations from the GBIF dataset include groups of 4-8 American wigeons and 10-30 mallards within a meadow ecosite west of the AOI that matches SWH criteria (**Figure D-1**; **Table D-1**). Other waterfowl species, including blue-winged teal (provincially rare), American black duck, green-winged teal, gadwall, northern pintail, northern shoveler, and wood duck have been observed within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER}. These observations ranged from groups of 1-40 individuals; however, even when combined across species, there may not be high enough abundance within an area to meet the SWH criteria.

For candidate SWH to be confirmed as SWH, any mixed species aggregation of 100 or more individuals is required (OMNRF 2015). Candidate SWH areas (including "unknown" plots) should be re-assessed in the spring for the presence of sheet water and waterfowl species presence, abundance, and habitat use.

4.1.2 Waterfowl Stopover and Staging Areas (Aquatic)

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 521 polygons that matched 6E ECS criteria (**Figure D-2**, **Table E-1**). Ecosite matches were primarily hardwood swamps, with a few marshes also identified.

Of the 473 TEM plots assessed in the field, seven (1.5%) were identified as candidate SWH, three (0.6%) were assigned as "unknown", and the remaining 463 (97.9%) were not considered suitable Waterfowl Stopover and Staging Areas (Aquatic) (**Figure D-2**). However, at four "not suitable" plots, surveyors noted possible candidate SWH at an adjacent or nearby lake, including Schmidt Lake. The "unknown" plots were not open areas with enough standing water during the summer survey but conditions in the spring could potentially support waterfowl. One candidate SWH plot was located within the AOI while the other six plots were in the $RSA_{AVI-AQU}$ north of the LSA_{TER}.

Incidental observations of waterfowl were uncommon during the 2022 field studies. Canada geese, wood ducks, mallards[6], and unidentified duck and geese were incidentally observed on the Teeswater River and/or its tributaries within the AOI (**Figure D-2**; **Table D-2**). Wood ducks and unidentified ducks and geese were also observed at a few locations in and adjacent to the Greenock Swamp Wetland Complex (GSWC)

[6] Although wood duck and mallard are not listed in the 6E ECS for Waterfowl Stopover and Staging Areas (Aquatic), these species are included in the SWHMiST for Waterfowl Stopover and Staging Areas, which is indicated as being applicable to All of Ontario (MNRF 2014).

and Teeswater Wetland Complex within the $RSA_{AVI-AQU}$. eDNA metabarcoding analyses identified hooded merganser, mallard, and wood duck in various aquatic habitats within the AOI and/or LSA_{AQU} during summer and/or fall (see Section 4.2.4 in Appendix E, Chapter 1).

Notable migration observations from the GBIF dataset include 20 common mergansers and two Canada geese along the Teeswater River at Concession Road 8 within the AOI (**Figure D-2**; **Table D-3**); however, surveyors determined this marsh polygon to be unsuitable as SWH as it did not meet the 6E ECS habitat criteria for Waterfowl Stopover and Staging Areas (Aquatic). Similarly, a variety of waterfowl species (American wigeon, Canada goose, mallard, ring-necked duck) in groups of 4-30 were observed off Concession Road 8 within the LSA_{TER} west of the AOI. Surveyors identified this polygon as potentially meeting the 6E ECS habitat criteria for Waterfowl Stopover and Staging Areas (Terrestrial) (see Section 4.1.1) rather than as suitable aquatic habitat for migrating waterfowl. Another group of 20 Canada geese was observed outside of mapped ecosites near the southern boundary of the LSA_{TER}. The geographic coordinates are located on agricultural land and would not be suitable Waterfowl Stopover and Staging Areas (Aquatic). However, based on satellite imagery, it is possible that the geese were using the small pond within the hardwood forested ecosite west of Sideroad 25 North.

There are also numerous GBIF records of waterfowl within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER} during the migration (**Figure D-2**; **Table D-3**). In addition to the aforementioned species, blue-winged teal (provincially rare), canvasback (provincially rare), American black duck, bufflehead, cackling goose, common goldeneye, gadwall, green-winged teal, hooded merganser, lesser scaup, long-tailed duck, northern pintail, northern shoveler, red-breasted merganser, snow goose, white-winged scoter, and wood duck[6] have been detected. There are a few areas where more than 100 individuals of a species were observed together, including south of Clam Lake (groups of 131-540 Canada geese), Riversdale (groups of 500-700 Canada geese), and two locations within the central and northern portions of the GSWC (a group of 100 Canada geese and another group of 500 red-breasted mergansers). Furthermore, other areas may have greater than 100 individuals cumulatively across multiple waterfowl species.

For candidate SWH to be confirmed as SWH, aggregations of 100 or more of the observed listed species for seven days are required (OMNRF 2015).[7] Candidate SWH areas (including unknown" and "nearby" plots and locations with notable species observations) should be re-assessed in the spring and fall for waterfowl species presence, abundance, and habitat use.

4.1.3 Shorebird Migratory Stopover Area

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 145 marsh ecosites that matched 6E ECS criteria (**Figure D-3**, **Table E-1**).

None of the 473 TEM plots assessed in the field were identified to be suitable Shorebird Migratory Stopover Areas. No shorebirds of relevance to this SWH type were observed during 2022 field studies. Notable migration observations from the GBIF dataset include a variety of shorebirds – including lesser yellowlegs (Threatened), dunlin, least sandpiper, pectoral sandpiper, stilt sandpiper, semipalmated plover, and semipalmated sandpiper – ranging from groups of 1-20, at the marsh ecosite northwest of the intersection of Concession Road 8 and Sideroad 25 North within the AOI (**Figure D-3**; **Table D-4**). This

[7] The defining criteria for confirmed SWH in Ecoregion 6E are not described in full in this SWH appendix; only criteria relevant to species observed to date are included. Should additional species be observed during future baseline studies, the next iterations of this SWH appendix will include the applicable defining criteria.

ecosite was not selected for Tier 1 terrestrial field studies in 2022 as it did not meet the minimum area size and/or shape requirements for TEM plots (Zoetica 2022). A group of three spotted sandpipers was also observed in a marsh ecosite approximately 600 m to the west; this polygon was deemed "not suitable" as candidate SWH during field surveys as the habitat did not meet the 6E ECS criteria for Shorebird Migratory Stopover Area. In addition to the aforementioned species, greater yellowlegs and solitary sandpiper have been observed within the $RSA_{AVI-AQU}$ outside of the AOI and LSA_{TER}. However, the number of individuals recorded in these GBIF observations (ranging from 1-5) are likely insufficient to meet the requirements for SWH.

For candidate SWH to be confirmed as SWH, the presence of three or more of the listed species and >1,000 shorebird use days during the spring or fall migration period (i.e., the cumulative number of shorebirds counted per day over the course of the migration period) is required (OMNRF 2015)[7]. Furthermore, important habitat identified for the Threatened lesser yellowlegs is protected under the Ontario *ESA*. Candidate SWH areas (including locations with notable species observations) should be surveyed during spring and fall migration to determine species presence, abundance, and habitat use.

4.1.4 Raptor Wintering Area

Zoetica's desk-based analyses identified candidate SWH ecosites only for bald eagle. No ecosite matches were found for hawks/owls after additional screening for minimum size and habitat adjacency requirements. Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 307 ecosites that matched 6E ECS criteria for bald eagle wintering area (**Figure D-4**, **Table E-1**). Most ecosite matches consisted of hardwood swamps and forests, followed by mixedwood forests and swamps, and some conifer forests and swamps.

No candidate Raptor Wintering Areas for bald eagle were identified in the field. The following analysis of TEM plots is, therefore, only applicable to hawks/owls. Of the 169 TEM plots assessed within the RSA_{AVI} in the field, 52 (30.8%) were deemed candidate SWH, 20 (11.8%) were assigned as "unknown", and the remaining 97 (57.4%) were not considered suitable Raptor Wintering Areas for hawks/owls. Plots identified as candidate SWH typically constituted forested habitats (mature or with large trees) adjacent to upland habitats (e.g., agricultural fields) that would be suitable for hawks/owls (**Figure D-5**). Most "unknown" plots indicated a need for desk-based analyses of area size and adjacency of forest/upland polygons.

The single field observation of an unidentified hawk was not considered relevant to this SWH type due to the summer survey timing. However, notable winter observations from the GBIF dataset include four bald eagles (**Figure D-4**) and one each of red-tailed hawk and rough-legged hawk (**Figure D-5**) along the Teeswater River north of Bruce Road 6 within the AOI. Groups of 1-2 bald eagles and red-tailed hawks were also observed in the winter at another location within the LSA_{TER} south of the AOI. In addition to bald eagle, red-tailed hawk, and rough-legged hawk, other raptors observed within the RSA_{AVI} outside the AOI and LSA_{TER} include American kestrel and snowy owl (**Table D-5**).

For candidate SWH to be confirmed as SWH, one or more bald eagles, or at least 10 individuals and two of the listed hawk/owl species, must use the site regularly (three of five years) for a minimum of 20 days (OMNRF 2015).[7] Candidate SWH areas, especially those with previous observations of raptors, should be surveyed during the winter to assess species presence, abundance, and habitat use.

4.1.5 Bat Hibernacula

Zoetica's desk-based analyses did not find any ecosites within the RSA_{BAT} that matched 6E ECS criteria. Of the 473 TEM plots assessed in the field, one (0.2%) was identified as "unknown" candidate SWH due to the presence of a house less than 100 m away; the remaining 472 were not considered suitable Bat Hibernacula. Buildings are not considered to be SWH for either Bat Hibernacula or Bat Maternity Colonies (see Section 4.1.6 below) (OMNRF 2015); however, if it is confirmed that Endangered or Threatened bat species are using the house, which is located within the LSA_{TER} outside the AOI, their habitat would be protected under the Ontario *ESA*. Studies undertaken by the NBCP from 2020–2022 have not identified potential bat hibernacula within the AOI or the general SON-South Bruce siting area (Thorne et al. 2021, Sparrow-Scinocca et al. 2022, Thorne 2023). No incidental observations of hibernating bats have been recorded to date.

4.1.6 Bat Maternity Colonies

Out of 1,169 ecosites mapped within the RSA_{BAT}, Zoetica's desk-based analyses found 740 polygons that matched 6E ECS criteria (**Figure D-6**, **Table E-1**). Ecosite matches were spread across hardwood forests, hardwood swamps, mixedwood forests, and mixedwood swamps.

Of the 201 TEM plots within the RSA_{BAT} assessed in the field, 84 (41.8%) were identified as candidate SWH, 46 (22.9%) were assigned as "unknown", and the remaining 71 (35.3%) were not considered suitable Bat Maternity Colonies (**Figure D-6**). However, at six "not suitable" plots, surveyors noted that there may be candidate SWH in other areas of the ecosite or within adjacent ecosites. "Unknown" plots were often marked as such because the required snag density for this SWH type (>10 snags/ha (OMNRF 2015)) had not been assessed. Plots identified as candidate SWH typically constituted forested habitats with large (>25 cm diameter at breast height [dbh]) trees, snags, and cavities or loose bark. Cavity trees on and off survey plots, throughout the AOI, LSA_{TER}, and RSA_{BAT}, were further described as incidental observations of candidate Bat Maternity Colonies and potentially other wildlife habitat (e.g., for raccoons). Of note, surveyors recorded a high density of cavity trees in an organic ash/maple swamp within the southern portion of the AOI (**Figure D-6**; **Table D-6**). This TEM plot was marked as "unknown" candidate SWH as use by bats was not confirmed. Four other locations within the AOI had a medium density of cavity trees and were assigned as either "yes" or "unknown" candidate SWH during TEM surveys. No bat activity or use of cavity trees was recorded during 2022 field studies.

From 2020–2022, the NBCP studied bats within the BIS study areas and the greater SON-South Bruce siting area (Thorne et al. 2021, Sparrow-Scinocca et al. 2022, Thorne 2023). Five colonially-roosting bat species, including three SAR, were detected through acoustic monitoring: Restricted Species M1, Restricted Species M2, Restricted Species M3, big brown bat, and silver-haired bat[8]. Activity levels determined through acoustic monitoring triggered exploratory trap-and-release and radio-telemetry efforts for Restricted Species M1. NBCP researchers mist-netted breeding individuals of Restricted Species M1 and big brown bat within the RSA_{BAT}, and radio-tracking of a single post-parturition female Restricted Species M1 identified potential nighttime foraging habitats (marsh and forest) and daytime roosting locations. NBCP researchers concluded that it is highly probable that the tagged Restricted Species M1 was roosting in a maternity colony located in a building within the RSA_{BAT} (Sparrow-Scinocca et al. 2022). Additional

[8] Silver-haired bat is not currently listed on SARO or Schedule 1 of the federal *Species at Risk Act* (*SARA*). However, this species was recently designated as Endangered by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) in May 2023.

information about at-risk bat detections from the NBCP studies is presented in Section 6.3.2.1 of Chapter 4.

Although bat maternity colonies in buildings are not considered SWH (OMNRF 2015), the habitat of Threatened or Endangered bat species would be protected under the Ontario *ESA*. Furthermore, ongoing research in collaboration with the NBCP may identify maternity roosts of other bat species in natural/naturalized habitats within the BIS study areas, such as the candidate SWH ecosites identified in **Figure D-6**. For candidate SWH to be confirmed as SWH, the presence of maternity colonies with confirmed use by 10 or more big brown bats or five or more adult female silver-haired bats is required (OMNRF 2015).

4.1.7 Turtle Wintering Areas

Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 1,068 polygons that matched 6E ECS criteria (**Figure D-7**, **Table E-1**). Most ecosite matches consisted of hardwood swamps, followed by mixedwood swamps and marshes, and then conifer swamp, shrub swamp, and lake/river ecosites.

Of the 473 TEM plots assessed in the field, 13 (2.7%) were identified as candidate SWH, eight (1.7%) were assigned as "unknown", and the remaining 452 (95.6%) were not considered suitable Turtle Wintering Areas (**Figure D-7**). However, at three "not suitable" plots, surveyors noted that there may be candidate SWH in adjacent habitats with deeper water (e.g., lakes, marshes). There is one plot identified as candidate SWH, located in a marsh polygon north of Bruce Road 6, and three "unknown" plots within the AOI. Some plots were marked "unknown" because it is unclear if the water is deep enough not to freeze to the bottom. In addition, Aquatic Habitat Mapping (AHM) surveys identified a few stream reaches within and north of the AOI with pool habitats and muck substrate (see Figures B-2 and B-3 in Appendix D, Chapter 1). These stream reaches, as well as lakes and ponds throughout the $RSA_{HRP-AQU}$, could provide suitable turtle overwintering habitat and should be further investigated.

There were two field observations of a midland painted turtle[9] (potentially the same animal) on the eastern shore of Meyer Lake at the northern portion of the $RSA_{HRP-AQU}$ (**Figure D-7**; **Table D-7**); this survey plot was also identified as candidate SWH. As wintering areas for most turtles are in the same general area as their core habitat, this turtle could remain in Meyer Lake to overwinter. Snapping turtles and a midland painted turtle were observed in the field at three locations within 200 m of each other, in the northern portion of the AOI. One surveyor noted that the snapping turtle was "resting". As the observation was made on September 29, it is possible that the turtle was basking and may overwinter in the waterbody.

The NHIC has mapped an extensive EO for snapping turtle that overlaps with the majority of the AOI, LSA_{TER}, and $RSA_{HRP-AQU}$. This EO includes 169 observations of snapping turtle from 1981 to 2004, and the EO has been designated as "Verified extant (viability not assessed)" by the NHIC. There are also two GBIF records of snapping turtle within the $RSA_{HRP-AQU}$ outside the AOI and LSA_{TER} outside the breeding season (**Figure D-7**; **Table D-8**). Depending on the life requisites that the habitat fulfils for snapping turtle, Turtle Wintering Area and/or Turtle Nesting Area (see Section 4.3.4) SWH could be identified. However, details

[9] Midland painted turtle and eastern milksnake are not currently listed on SARO but they are listed as Special Concern on Schedule 1 of *SARA* and also designated as Special Concern by COSEWIC.

regarding known or potential overwintering or nesting areas are not indicated in the EO record and further field studies and/or discussions with NHIC are needed.

For candidate SWH to be confirmed as SWH, the presence of five overwintering midland painted turtles, or one or more overwintering northern map turtle or snapping turtle (both Special Concern), is required (OMNRF 2015). Candidate SWH areas should be searched in the fall (September to October) or spring (March to May) for turtle congregations (i.e., basking areas) and to assess species presence, abundance, and habitat use.

4.1.8 Reptile Hibernaculum

Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 784 polygons that matched 6E ECS criteria for common five-linked skink (Great Lakes/St. Lawrence population, Special Concern) (**Figure D-8**, **Table E-1**). Most ecosite matches consisted of hardwood forests, followed by mixedwood forests and some conifer forests. As hibernacula for snakes can be found in any ecosite, except for very wet ones (OMNRF 2015), other ecosites within the BIS study areas were not highlighted on **Figure D-8**. Rather, field-based identification of candidate SWH, as described below, will be more useful in determining the potential presence of Reptile Hibernacula.

Of the 473 TEM plots assessed in the field, 85 (18.0%) were identified as candidate SWH, 45 (9.5%) were assigned as "unknown", and the remaining 343 (72.5%) were not considered suitable Reptile Hibernacula (**Figure D-8**). Twenty candidate SWH and 12 "unknown" plots are located within the AOI. Some plots were noted as having a high water table and may be suitable for eastern ribbonsnake but not other reptile species; while other plots consisting of treed areas near agricultural fields were noted as possible habitat for eastern milksnake.[9] Other plots were marked "unknown" because suitable habitat features (e.g., burrows, rock piles, crevices, tree stumps/roots) were not observed within the plot but may be present elsewhere in the polygon.

Two candidate Reptile Hibernacula were recorded within the $RSA_{HRP-AQU}$ north and south of the AOI and LSA_{TER} (**Figure D-8**; **Table D-9**). Surveyors noted a "large rock pile and remnant of rock wall" and a mammal burrow that may be suitable for snake species. Eastern gartersnakes were incidentally observed at four locations and shed snakeskin (unidentified species) was found near Oppleck Lake within the $RSA_{HRP-AQU}$ north of the AOI and LSA_{TER}. Two of these eastern gartersnake observations occurred in late September; for the observation southeast of Schmidt Lake in a red maple swamp, surveyors noted the possibility of a hibernaculum nearby. The other observation, located within the southern portion of the $RSA_{HRP-AQU}$, was of an eastern gartersnake "sunning itself, late in season" in a corn field, which could also suggest a potential hibernaculum nearby. In addition, surveyors noted that the shed snakeskin was located at a potential burrow entrance in the bottom of a hollow tree. No other relevant reptile observations were available from existing desk-based datasets.

For candidate SWH to be confirmed as SWH, the presence of a hibernaculum used by a minimum of five individuals of a single snake species, or individuals of two or more snake species, is required (OMNRF 2015). Candidate SWH areas should be searched in the spring (April to May) or fall (September to October) for reptile congregations (i.e., basking areas) and to assess species presence, abundance, and habitat use.

4.1.9 Colonially-Nesting Bird Breeding Habitat (Bank and Cliff)

Out of 925 ecosites mapped within the RSA_{AVI}, Zoetica's desk-based analyses found 28 meadow ecosites and one shrub ecosite that matched 6E ECS criteria (**Figure D-9**, **Table E-1**).

Of the 169 TEM plots within the RSA_{AVI} assessed in the field, none were identified as candidate SWH, two (1.2%) were assigned as "unknown", and the remaining 167 (98.8%) were not considered suitable Colonially-Nesting Bird Breeding Habitat (Bank and Cliff) (**Figure D-9**). Both "unknown" plots are located along the Teeswater River within the AOI; one within a meadow polygon and the other in a shrub polygon. Neither polygon was identified as candidate SWH through desk-based ecosite analyses; however, field work identified eroding banks that could be suitable breeding habitat for bank swallows (Threatened). One bank swallow was observed travelling/feeding in a "heavily vegetated meadow" along the Teeswater River within the AOI (**Figure D-9**; **Table D-10**). The associated TEM plot was not considered candidate SWH; however, one of the "unknown" plots is located approximately 650 m upstream. No other bank/cliff-nesting swallow species were observed in the field in 2022.

From the GBIF dataset, one northern rough-winged swallow, two bank swallows, and eight cliff swallows have been observed within the AOI (**Figure D-9**; **Table D-11**). The location with eight cliff swallows is along a tributary of Alps Creek and close to the Teeswater River; both watercourses could potentially have suitable eroding banks for nesting. Unfortunately, this area was inaccessible and could not be surveyed in 2022. Another notable area, where one bank swallow, five cliff swallows, and at least two northern rough-winged swallows were observed, is located south of the LSA_{TER} near the intersection of Concession Road 4 and Sideroad 25 N. Based on satellite imagery, there is an aggregate pit near this location that the swallows could be using, but a licensed/permitted aggregate area would not be considered SWH (OMNRF 2015). Bank swallows have also been observed at three other locations within the RSA_{AVI} outside the AOI and LSA_{TER}.

For candidate SWH to be confirmed as SWH, the presence of one or more nesting sites with eight or more cliff swallow pairs and/or northern rough-winged swallow pairs during the breeding season is required (OMNRF 2015). Furthermore, important habitat identified for the Threatened bank swallow would be protected under the Ontario *ESA*. Targeted surveys should be conducted at candidate SWH areas to determine species presence, abundance, and habitat use.

4.1.10 Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs)

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 657 polygons that matched 6E ECS criteria (**Figure D-10**, **Table E-1**). Ecosite matches were primarily hardwood swamps, followed by mixedwood swamps, as well as two fen ecosites.

Of the 473 TEM plots assessed in the field, 37 (7.8%) were identified as candidate SWH, 44 (9.3%) were assigned as "unknown", and the remaining 392 (82.9%) were not considered suitable Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs) (**Figure D-10**). For two plots marked as "not suitable", surveyors noted the potential for nesting elsewhere in the same ecosite and in adjacent swamp habitat. Five candidate SWH and 11 "unknown" plots are located within the AOI. Although no colony nests were observed in the field, great blue herons and/or green herons were observed throughout the AOI, LSA_{TER}, and $RSA_{AVI-AQU}$ (**Figure D-10**; **Table D-12**), including at one candidate SWH and two "unknown" plots within the AOI. Of note, surveyors recorded "multiple" great blue herons and green herons at the candidate SWH plot. At five locations where heron(s) were incidentally observed (one along the Teeswater River within

each of the AOI and LSA_{TER}, three in the GSWC within the $RSA_{AVI-AQU}$), surveyors also noted the potential for a nest or nesting colony nearby.

From the GBIF dataset, great blue herons were also observed at two locations along the Teeswater River or its tributary within the AOI. All other GBIF observations of great blue heron, green heron, and great egret (provincially rare) occurred within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER} (**Figure D-10**; **Table D-13**). Notable observations of more than five individuals were located south of Clam Lake and northern portions of the GSWC. It is unclear if any of these observations include active nests (as GBIF records do not contain such information). Based on the NHIC Wildlife Concentration Areas Observation dataset, two great blue heron nesting sites/colonies have been documented within or overlapping the BIS study areas (**Figure D-10**). One colony of 22 nests was originally documented in 1967 east of the AOI near Teeswater. The colony was located within a woodland depression and nests were constructed in live silver maple, red maple, and elm trees. However, due to logging activity and a decline in fish populations in the area in the late 1980s, the herons deserted the colony nesting site and it has been considered "extinct" since 1991. In the northwestern portion of the GSWC (and $RSA_{AVI-AQU}$), a small heronry was found during the OBBA Atlas-2 (2001-2005) surveys. The colony was noted as having been active for at least four years; however, it is unclear when this information was provided, and if the colony is still active. The NHIC continues to designate both polygons as EO Candidates.

For candidate SWH to be confirmed as SWH, the presence of five or more active nests of the listed species is required (OMNRF 2015). Site visits should be conducted to the historic heronry and other candidate SWH areas during the nesting season (April to August) to confirm species presence, abundance, and nest activity status.

4.1.11 Colonially-Nesting Bird Breeding Habitat (Ground)

Zoetica's desk-based analyses identified candidate SWH ecosites only for Brewer's blackbird (also a provincially rare species), as there are no rocky islands or peninsulas associated with a lake or large river within the AOI, LSA_{TER}, and $RSA_{AVI-AQU}$ that would be suitable for colonially-nesting gulls and terns. Out of 925 ecosites mapped within the RSA_{AVI}, 95 marsh, 28 meadow, and one shrub ecosite matched 6E ECS criteria for Brewer's blackbird (**Figure D-11**, **Table E-1**).

Similarly, no candidate SWH for colonially-nesting gulls and terns was identified in the field. The following analysis of TEM plots is, therefore, only applicable to Brewer's blackbird. Of the 169 TEM plots assessed within the RSA_{AVI} in the field, four (2.4%) were identified as candidate SWH and the remaining 165 (97.6%) were not considered suitable Colonially-Nesting Bird Breeding Habitat (Ground). All four plots identified as candidate SWH were located within the AOI in open marsh habitats close to watercourses (**Figure D-11**), which surveyors noted may be suitable breeding habitat for Brewer's blackbird (but not gulls or terns). To date, no incidental observations of Brewer's blackbird or other relevant species for this SWH type have been recorded in the field or existing datasets during the breeding season.

From the GBIF dataset, there are numerous records of ring-billed gulls and herring gulls within the BIS study areas (data not mapped); all but one observation (a single ring-billed gull near the southern boundary of the AOI) are located within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER}. Notable observations with more than 25 individual gulls are located within the central and northern portions of the GSWC. In addition, there are three records of Caspian tern (provincially rare) at Schmidt Lake and Silver Lake, and one record of a great black-backed gull (provincially rare) within the GSWC (see Section 4.3.2.1 in Chapter

7). It is unclear if any of these observations include active nests (as GBIF records do not contain such information). These observations will be mapped in future iterations of the SWH appendix if additional baseline data are found to support candidate Colonially-Nesting Bird Breeding Habitat (Ground) SWH for gulls and terns.

For candidate SWH to be confirmed as SWH, the presence of 25 or more active nests of herring gull or ring-billed gull, two or more active nests of Caspian tern, five or more pairs of Brewer's blackbird, or any active nesting colony of great black-backed gull, is needed (OMNRF 2015).[7] Candidate SWH areas should be surveyed during May/June when birds are actively nesting.

4.1.12 Deer Yarding Areas

Out of 1,260 ecosites mapped within the RSA_{UNG}, Zoetica's desk-based analyses found 577 polygons that matched 6E ECS criteria (**Figure D-12**, **Table E-1**). Most ecosite matches consisted of mixedwood forest, mixedwood swamp, and conifer forest; however, there were also numerous conifer swamp and plantation ecosites, as well as a two shrub ecosites.

Of the 213 TEM plots within the RSA_{UNG} assessed in the field, 175 (82.2%) were assigned as "unknown" and the remaining 38 (17.8%) were not considered suitable Deer Yarding Areas (**Figure D-12**). For many "unknown" plots and some "not suitable" plots, surveyors (correctly) noted that the MNRF is responsible for determining and mapping this SWH type. Other entries for "unknown" plots provided brief descriptions of the habitat, incidental observations of white-tailed deer sign, and evidence of being in a deer hunting area. Incidental deer observations were common throughout the AOI, LSA_{TER}, and RSA_{UNG} (see **Figure D-20** for deer observations in the context of Seeps and Springs SWH); however, these observations were not considered relevant to Deer Yarding Areas due to the summer and early fall (early July to mid-October) survey timing.

Based on the MNRF's Wildlife Values Area dataset, there are currently no White-tailed Deer Yard (Stratum I) areas identified within the AOI, LSA_{TER}, and RSA_{UNG} and, thus, Deer Yarding Areas are assumed to be absent. Future discussions with MNRF (e.g., as part of ongoing stakeholder and rights-holder engagement) may indicate that suitable habitats for Deer Yarding Areas (e.g., "unknown" plots) should be further investigated.

4.1.13 Deer Winter Congregation Areas

Out of 1,260 ecosites mapped within the RSA_{UNG}, Zoetica's desk-based analyses found 423 polygons that matched 6E ECS criteria (**Figure D-12**, **Table E-1**). Most ecosite matches consisted of hardwood and mixedwood swamps and forests, followed by conifer forests and swamps.

Of the 213 TEM plots within the RSA_{UNG} assessed in the field, 185 (86.9%) were assigned as "unknown" and the remaining 28 (13.1%) were not considered suitable Deer Winter Congregation Areas (**Figure D-12**). Similar to Deer Yarding Areas (Section 4.1.12), field surveyors correctly noted that it is MNRF's responsibility to determine and map this SWH type. Other entries for "unknown" plots provided brief descriptions of the habitat, incidental observations of white-tailed deer signs, and evidence of being in a deer hunting area. Incidental deer observations were common throughout the AOI, LSA_{TER}, and RSA_{UNG} (see **Figure D-20** for deer observations in the context of Seeps and Springs SWH); however, these observations were not considered relevant to Deer Winter Congregation Areas due to the summer and early fall (early July to mid-October) survey timing.

MNRF has identified five White-tailed Deer Wintering Areas (Stratum II) within the RSA_{UNG} (**Figure D-12**). The largest of these areas overlaps the GSWC, where the southern tip of this Deer Wintering Area extends into the northern portion of the LSA_{TER}. When all five polygons were mapped/verified in 2004, these Deer Wintering Areas were designated as "Presently Suitable" and had evidence of species use; however, no ranking of significance is provided in the dataset. To be conservative, Zoetica will consider the MNRF-mapped Deer Wintering Areas as confirmed SWH.

4.2 Rare Vegetation Communities

4.2.1 Cliffs and Talus Slopes

To date, no desk- or field-based observations have indicated the potential presence of candidate Cliff and Talus Slopes SWH.

4.2.2 Sand Barren

To date, no desk- or field-based observations have indicated the potential presence of candidate Sand Barren SWH. One 2022 field entry in an upland conifer ecosite within the LSA_{TER} (outside the AOI; not mapped) indicated that sand barren habitat was present, but it was heavily disturbed and specialized vegetation species were not present. Therefore, this area would not meet the criteria for SWH.

4.2.3 Alvar

Out of 2,155 ecosites mapped within the RSA_{VEG}, Zoetica's desk-based analyses found 58 conifer ecosites that matched 6E ECS criteria (**Figure D-14**, **Table E-1**). To date, no field-based observations have indicated the potential presence of candidate Alvar SWH within the TEM plots surveyed. However, field work was only conducted at seven of the candidate SWH ecosites identified through desk-based analyses, including one close to the southern boundary of the AOI. Future investigations for rare alvar habitat should prioritize the unassessed polygons.

4.2.4 Old Growth Forest

Out of 2,155 ecosites mapped within the RSA_{VEG}, Zoetica's desk-based analyses found 1,135 ecosites that matched 6E ECS criteria (**Figure D-15**, **Table E-1**). Ecosite matches were primarily hardwood swamps and forests, followed by mixedwood forests and swamps and, to a lesser extent, conifer forests and swamps.

Of the 473 TEM plots assessed in the field, one (0.2%) was identified as candidate SWH, seven (1.5%) were assigned as "unknown", and the remaining 465 (98.3%) were not considered suitable Old Growth Forest (**Figure D-15**). Candidate SWH and "unknown" plots were only located within the RSA_{VEG} outside the AOI and LSA_{TER}. The single plot identified as candidate SWH had multiple trees with >90 dbh and is located in a hardwood swamp in the northern portion of the GSWC. "Unknown" plots also had mature, large diameter trees; however, surveyors noted that stand age needs to be confirmed using historic aerial imagery.

To date, incidental observations of Old Growth Forest indicator/representative/associated bird species, as noted in the SWHMiST (MNRF 2014), have been recorded within the AOI and RSA_{VEG} (outside the LSA_{TER}). Evidence of pileated woodpecker foraging excavations was observed in a conifer swamp within the AOI during 2022 field studies (**Figure D-15**; **Table D-14**). In addition, winter wren, pileated woodpecker, and brown creeper were detected in various parts of the GSWC during the breeding season.

However, none of the survey plots where these species were observed were considered candidate SWH as the habitat at these plots did not meet the 6E ECS criteria for Old Growth Forest.

The GBIF dataset also includes numerous breeding season observations of brown creeper, winter wren, pileated woodpecker, and bald eagle within the RSA_{VEG} outside the AOI and LSA_{TER}, especially within the GSWC (**Figure D-15**; **Table D-15**). These bird observations may provide some support of the presence of Old Growth Forest; however, the defining criteria for this SWH type are characteristics of the forest itself and these will need to be confirmed through further investigations.

4.2.5 Savannah

To date, no desk- or field-based observations have indicated the potential presence of candidate Savannah SWH.

4.2.6 Tallgrass Prairie

To date, no desk- or field-based observations have indicated the potential presence of candidate Tallgrass Prairie SWH.

4.2.7 Other Rare Vegetation Communities

Based on the NHIC's Plant Community Occurrence and Observation datasets, there are no records of provincially tracked (i.e., rare) vegetation communities within the AOI, LSA_{TER}, or RSA_{VEG}. Field crews in 2022 noted the presence of potentially rare communities, including black ash swamp, bur oak forest and swamp, hemlock swamp, organic swamp, sugar maple, winterberry, and rare orchids and carnivorous wetland vegetation. Some of these observations may correspond to rare vegetation communities listed in Appendix M of the *Significant Wildlife Habitat Technical Guide* (OMNR 2000), such as White Cedar – Hemlock Coniferous Organic Swamp Type (listed as Southern Ontario ELC Code FOC4-2)[10], Moist – Fresh Black Oak – White Oak Tallgrass Woodland Type (TPW2-1), Moist – Fresh Pin Oak Tallgrass Woodland Type (TPW2-2), Moist – Fresh Sugar Maple – Black Maple Deciduous Forest Type (FOD6-2), and Winterberry Organic Thicket Swamp Type (SWT3-7). However, due to the challenges of converting GLSE assignments to the ELC-1998 system and vice versa, it is unclear which GLSE ecosites would be considered rare vegetation communities in the SON-South Bruce siting area. Further discussions with the authors of the GLSE classification system (Lee et al. 2021a) and NHIC are needed to reconcile the current ambiguities.

Note: Black ash was added as an Endangered species on the Species at Risk in Ontario (SARO) List (O. Reg. 230/08) in January 2022 and is now protected under the Ontario *ESA*. Except when black ash is mentioned as part of other provincially tracked, rare vegetation communities, this species and its habitat are discussed in more detail in the Vegetation chapter (Section 1.3.3.1, Chapter 2).

[10] The Southern Ontario ELC Codes listed in Appendix M of the *Significant Wildlife Habitat Technical Guide* are from the 1998 first approximation system. There may be a typo in Appendix M since FOC4-2 is defined as "Fresh – Moist White Cedar – Hemlock Coniferous Forest Type" in ELC-1998. A more suitable ELC Code would be SWC3-2, which is "White Cedar – Conifer Organic Coniferous Swamp Type".

4.3 Specialized Habitat for Wildlife

4.3.1 Waterfowl Nesting Area

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 355 ecosites that matched 6E ECS criteria (**Figure D-16**, **Table E-1**). Ecosite matches were primarily hardwood swamps and marshes but also included some shrub swamp ecosites.

Of the 473 TEM plots assessed in the field, 49 (10.4%) were identified as candidate SWH, 16 (3.4%) were assigned as "unknown", and the remaining 408 (86.3%) were not considered suitable Waterfowl Nesting Areas (although suitable habitat was observed outside one "not suitable" polygon) (**Figure D-16**). Thirteen candidate SWH and four "unknown" plots are located within the AOI. Surveyors noted the potential for ground-nesting and/or cavity-nesting waterfowl species in these areas.

Incidental observations of waterfowl were uncommon during the 2022 field studies. Wood ducks (or their nest boxes) and unidentified ducks were observed within the AOI and $RSA_{AVI-AQU}$; mallards were also observed on the Teeswater River near upland habitat within the AOI (**Figure D-16**; **Table D-16**). In addition, eDNA metabarcoding analyses identified hooded merganser, mallard, and wood duck in various aquatic habitats within the AOI and/or LSA_{AQU} during summer and/or fall (see Section 4.2.4 in Appendix E, Chapter 1). Although active nest boxes are not considered SWH, wood ducks could potentially be breeding in natural cavities elsewhere in the area. Of note, two adult and three juvenile wood ducks were recorded swimming/travelling/feeding within the $RSA_{AVI-AQU}$ north of Silver Lake. This observation is located in an agricultural field approximately 100 m east of two small ponds within a marsh ecosite, which may be suitable waterfowl nesting habitat.

Notable nesting season observations from the GBIF dataset include 15 Canada geese at a marsh ecosite northwest of the intersection of Concession Road 8 and Sideroad 25 North within the AOI (**Figure D-16**; **Table D-17**). This ecosite was not surveyed in 2022 as it did not meet the minimum area size and/or shape requirements for TEM plots. Two Canada geese and 20 common mergansers were observed at another marsh ecosite along the Teeswater River (or potentially within the river) at Concession Road 8. However, surveyors did not consider this ecosite to be candidate SWH as the habitat did not meet the 6E ECS criteria for Waterfowl Nesting Area; thus, the birds may have been using the marsh or watercourse as foraging habitat. A group of 20 Canada geese was also observed outside of mapped ecosites along Concession Road 8 within the LSA_{TER} east of the AOI. These geese may have been using the agricultural fields or simply flying over; no additional information was included in the GBIF record. There are numerous GBIF records of waterfowl within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER} during the breeding season (**Figure D-16**; **Table D-17**). In addition to the aforementioned species, blue-winged teal (provincially rare), hooded merganser, American black duck, northern pintail, northern shoveler, gadwall, green-winged teal, American widgeon, bufflehead, common goldeneye, and red-breasted merganser have been detected.[11] However, it is unclear if any of these observations include active nests or confirmation of breeding (as GBIF records do not contain such information).

[11] Although Canada goose, common merganser, American widgeon, bufflehead, common goldeneye, and red-breasted merganser are not listed in the 6E ECS, these species are included in the SWHMiST for Waterfowl Nesting Area, which is indicated as being applicable to All of Ontario (MNRF 2014). However, further discussions with MNRF are needed to determine how many nesting pairs of Canada geese are needed to constitute SWH.

For candidate SWH to be confirmed as SWH, the presence of three or more nesting pairs of the listed species (excluding mallards), or the presence of 10 or more nesting pairs of the listed species (including mallards), is required (OMNRF 2015).[7] Candidate SWH areas should be surveyed during the spring breeding season (April to June) to determine waterfowl species presence, abundance, and habitat use.

4.3.2 Bald Eagle and Osprey Nesting, Foraging, and Perching Habitat

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 307 ecosites that matched 6E ECS criteria (**Figure D-17**, **Table E-1**). Most ecosite matches consisted of hardwood swamps and forests, followed by mixedwood forests and swamps, and some conifer forests and swamps.

Of the 473 TEM plots assessed in the field, 23 (4.9%) were identified as candidate SWH, 10 (2.1%) were assigned as "unknown", and the remaining 440 (93.0%) were not considered suitable Bald Eagle and Osprey Nesting, Foraging, and Perching Habitat (**Figure D-17**). Plots identified as candidate SWH had mature trees and were located near fish-bearing waterbodies and watercourses, such as the Teeswater River within the AOI and Schmidt Lake, Cunningham Lake, and Silver Lake within the $RSA_{AVI-AQU}$. However, surveyors also noted that two plots are likely not suitable for bald eagle due to the lack of super canopy trees. Many "unknown" plots were marked as such due to uncertainty about sufficient foraging habitat.

To date, there have been no desk- or field-based observations of bald eagle or osprey during the breeding season, nor their stick nests, within the AOI or LSA_{TER}. However, there are a number of GBIF observations of both species within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER} (**Figure D-17**; **Table D-18**). Notable records of more than one individual include six bald eagles outside the northwest boundary of the LSA_{TER}, two bald eagles and two osprey at Silver Lake, two bald eagles and an osprey south of Clam Lake, four bald eagles near Highway 9 near the GSWC, two osprey at Schmidt Lake, and two bald eagles in Teeswater (likely along the Teeswater River). It is unclear if any of these observations include active nests (as GBIF records do not contain such information).

For candidate SWH to be confirmed as SWH, one or more active osprey or bald eagle nests must be present (OMNRF 2015). Candidate SWH areas should be surveyed during mid-March to mid-August to determine species presence and habitat use.

4.3.3 Woodland Raptor Nesting Habitat

Out of 925 ecosites mapped within the RSA_{AVI}, Zoetica's desk-based analyses found 54 ecosites that matched 6E ECS criteria (**Figure D-18**, **Table E-1**). Ecosite matches included (in order of descending frequency) mixedwood swamps, hardwood swamps, hardwood forests, mixedwood forests, conifer forests, and conifer swamps.

Of the 169 TEM plots within the RSA_{AVI} assessed in the field, 96 (56.8%) were identified as candidate SWH, 17 (10.1%) were assigned as "unknown", and the remaining 56 (33.1%) were not considered suitable Woodland Raptor Nesting Habitat (**Figure D-18**). Desk-based ecosite analyses had screened out all polygons in the AOI and LSA_{TER} not connected to the larger GSWC (which extends into the RSA_{AVI}) due to minimum size requirements. However, the presence of one or more active nests of the woodland raptor species listed in the 6E ECS is considered SWH (OMNRF 2015). Therefore, suitable habitats of non-optimal size should remain as candidate SWH and be further investigated for active raptor nests from mid-March to the end of May. Most "unknown" plots indicated a need for desk-based analysis of area size.

Only one incidental woodland raptor observation recorded during 2022 field studies was located within the BIS study areas for raptors – hawk feathers were found and an unidentified hawk was observed flying out of a tree in the southwest portion of the AOI (**Figure D-18**; **Table D-19**). This TEM plot, located within a hardwood forest polygon, was identified as candidate SWH. The GBIF dataset includes one record for Cooper's hawk within the AOI near Bruce Road 6 during the breeding season. Two other raptor species have been observed within the RSA_{AVI} outside the AOI and LSA_{TER}: great horned owl and merlin.[12] Most GBIF records consist of a single individual; however, in the area south of the LSA_{TER}, within hardwood and conifer forest ecosites, there are three observations of two broad-winged hawks and Cooper's hawks (**Figure D-18**; **Table D-20**), which could suggest breeding pairs. It is unclear if any of these observations include active nests (as GBIF records do not contain such information).

4.3.4 Turtle Nesting Areas

Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 15 marsh polygons that matched 6E ECS criteria (**Figure D-19**, **Table E-1**).

Of the 473 TEM plots assessed in the field, six (1.3%) were identified as candidate SWH, 10 (2.1%) were assigned as "unknown", and the remaining 457 (96.6%) were not considered suitable Turtle Nesting Areas (**Figure D-19**). Three plots marked as "not suitable" and two "unknown" plots had additional surveyor notes indicating that nearby habitats may be candidate SWH based on habitat characteristics and/or observations of turtle nests. None of the candidate SWH plots are located within the AOI; two are in the LSA_{TER} and four are in the $RSA_{HRP-AQU}$. The candidate SWH plot on the west side of Silver Lake is corroborated by AHM surveys, which found sand/gravel shoreline on the west and north sides of the lake (see Figure C-4 in Appendix D, Chapter 1). The single polygon identified as candidate SWH within the AOI, via desk-based ecosite analyses, was not ground-truthed in 2022 as it did not meet the minimum area size and/or shape requirements for TEM plots. However, there are four "unknown" plots in a variety of habitats (meadow, mixedwood swamp, mixedwood forest, hardwood forest ecosites) along the Teeswater River or one of its tributaries within the AOI.

Field observations in 2022 include the remnants of suspected snapping turtle eggs in the riparian area along the Teeswater River next to a soy field within the AOI (**Figure D-19**; **Table D-21**). If the species is confirmed as snapping turtle, this area would constitute SWH. There were five additional observations of turtle nests and eggs (unknown species)[13], including observations at three locations along the Teeswater River within the AOI and one along Alps Creek within the $RSA_{HRP-AQU}$ south of the LSA_{TER}. Two of the turtle nests within the AOI and the nest outside the AOI had evidence of predation. In addition to field observations, there are three GBIF records of snapping turtle during the breeding season close to the northern and southern boundaries of the $RSA_{HRP-AQU}$ (**Figure D-19**; **Table D-22**). The NHIC's EO for snapping turtle was previously discussed for Turtle Wintering Areas (see Section 4.1.7).

For candidate SWH to be confirmed as SWH, the presence of five or more nesting midland painted turtles, or one or more nesting northern map turtle or snapping turtle, is required (OMNRF 2015). Candidate SWH

[12] Although great horned owl and merlin are not listed in the 6E ECS, these species are included in the SWHMiST for Woodland Raptor Nesting Habitat, which is indicated as being applicable to All of Ontario (MNRF 2014).

[13] Based on the coordinates, two turtle egg observations are likely duplicates recorded by different surveyors.

areas (including "unknown" and "nearby" plots) should be further investigated in the late spring to early summer to determine species presence, abundance, and habitat use.

4.3.5 Seeps and Springs

Out of 2,155 ecosites mapped within the LSA_{ECO}, Zoetica's desk-based analyses found 841 polygons that matched 6E ECS criteria (**Figure D-20**, **Table E-1**). Ecosite matches were primarily hardwood forests, followed by mixedwood forests and some conifer forests.

Of the 473 TEM plots assessed in the field, 29 (6.1%) were identified as candidate SWH, 29 (6.1%) were assigned as "unknown", and the remaining 415 (87.7%) were not considered suitable habitat for Seeps and Springs (**Figure D-20**). However, at one "not suitable" plot, surveyors noted evidence of seeps/springs while in transit to the plot. Furthermore, surveyors incidentally recorded two candidate Seeps and Springs south of the LSA_{TER} outside of survey plots. The 31 candidate SWH ("yes" plots and incidental observations) – including five plots within the AOI – were determined to have seeps/springs through direct observations of groundwater seepage and indicators, including iron precipitates, oily/metallic sheen, depressions, watercress, eastern swamp saxifrage, and eastern rough sedge (**Figure D-20**; **Table D-23**). At the candidate SWH plot in the western portion of the AOI, along a tributary of the Teeswater River, TEM/SWH data are corroborated by AHM surveys, which found two seeps in a marsh ecosite and a groundwater source nearby in the adjacent conifer swamp ecosite (see Figure E-1 in Appendix, D, Chapter 1). In addition, AHM surveys identified two springs and one seep in close proximity to one another within a single conifer swamp polygon along Alps Creek, north of a TEM plot outside the LSA_{TER} that was marked as "unknown" candidate SWH.

The presence of a site with two or more seeps/springs is considered SWH (OMNRF 2015); however, the 6E ECS also notes that Seeps and Springs SWH are typically located in a forested ecosite or ecoelement. It is unclear whether the marsh ecosite containing two seeps would be considered SWH; further discussions with MNRF are needed. Nevertheless, AHM surveys identified another area with multiple seeps and/or springs, which should be SWH. Furthermore, TEM/SWH surveyor notes indicated that some plots may meet this criterion for confirmed Seeps and Springs SWH; however, other notes for both candidate SWH and "unknown" plots are more ambiguous and will need to be confirmed with the field data collection contractor and/or through additional ground-truthing.

The 2022 baseline data are valuable as these summer surveys identified potential seeps/springs that provide year-round moist conditions, which are likely more important habitats than seeps/springs that are present in the spring but dry up prior to or early in the summer (OMNR 2000). Sites that support species of conservation concern would also be assigned greater significance. No observations of wildlife use were noted at the TEM plots containing candidate Seeps and Springs SWH within the AOI. White-tailed deer sign was observed throughout the BIS study areas, including at one candidate SWH plot within the RSA_{UNG} (**Figure D-20**; **Table D-23**). A group of 10 wild turkeys was observed within the AOI, amongst willows in an agricultural field next to the Teeswater River. Wild turkeys and ruffed grouse were also detected in the GSWC. However, none of these relevant bird observations occurred at candidate SWH or "unknown" plots.

From the GBIF dataset, no sensitive salamander species have been observed, but ruffed grouse and wild turkeys were recorded at two different hardwood forest ecosites, and another location outside of mapped ecosites (i.e., on agricultural land), within the LSA_{TER} (**Figure D-20**; **Table D-24**). However, neither ecosite

polygon was determined to be candidate Seeps and Springs SWH during 2022 field studies. Numerous observations of ruffed grouse (ranging from 1-4 individuals) and wild turkey (ranging from 1-60 individuals) were also recorded in a hardwood and conifer forest ecosite (not surveyed in 2022) within the RSA_{AVI} south of the LSA_{TER}. It remains to be determined whether this area may be important for these game birds due to seeps/springs or other habitat features.

4.3.6 Amphibian Breeding Habitat (Woodland)

Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 1,664 polygons that matched 6E ECS criteria (**Figure D-21**, **Table E-1**). Ecosite matches were primarily hardwood swamps and forests, followed by mixedwood forests and swamps and, to a lesser extent, conifer forests and swamps.

Of the 473 TEM plots assessed in the field, 394 (83.3%) were identified as candidate SWH, 38 (8.0%) were assigned as "unknown", and the remaining 41 (8.7%) were not considered as suitable Amphibian Breeding Habitat (Woodland) (**Figure D-21**). Most of the "unknown" plots were marked as such due to uncertainty about the presence and longevity of vernal pools in the spring and summer. A variety of amphibians of relevance to this SWH type were detected throughout the AOI, LSA_{TER}, and $RSA_{HRP-AQU}$ during 2022 field studies. Wood frogs were most commonly observed; other species included spring peeper, American toad, gray treefrog, eastern newt, and unknown frog and amphibian species. eDNA metabarcoding analyses also identified four-toed salamander, eastern red-backed salamander, and eastern newt in various aquatic habitats within the AOI and/or LSA_{AQU} during summer and/or fall (see Section 4.2.3 in Appendix E, Chapter 1).[14]

Of note, surveyors recorded two separate incidental observations of "100" juvenile wood frogs in the eastern portion of the GSWC (**Figure D-21**; **Table D-25**). One observation describes the wood frogs within 10 m of a waterbody, located in a mixedwood forest habitat with vernal pools and ponds. The other observation, approximately 30 m away, describes the frogs in a beaver meadow within a deciduous forest. Both observations were recorded on the same day and the wood frogs were noted as travelling, resting, vocalizing, feeding, and startled. These observations also provide support for Amphibian Movement Corridors (Section 4.5.1).

Furthermore, tadpoles of unidentified frog/amphibian species were observed at two locations within the AOI and two within the $RSA_{HRP-AQU}$ outside the AOI and LSA_{TER} (**Figure D-21**; **Table D-25**). The tadpole observations within the AOI were located along the Teeswater River and its tributary, surrounded by marsh/mixedwood forest and conifer swamp ecosites, respectively. The number of individuals was not recorded for these incidental observations; nonetheless, these habitats should be further investigated to determine if they could be Amphibian Breeding Habitat SWH (Woodland or Wetlands; see Section 4.3.7). In addition to amphibian species detections, surveyors recorded three incidental observations of vernal pools, within the GSWC, as potential amphibian breeding habitat. These pools still had water at the time of survey in mid-late August, which would have allowed time for amphibians to complete metamorphosis. For two of these vernal pools, surveyors noted the presence of potential egg attachment sites (e.g., woody debris, vegetation).

[14] Although American toad, four-toed salamander, and eastern red-backed salamander are not listed in the 6E ECS, these species are included in the SWHMiST for Amphibian Breeding Habitat (Woodland), which is indicated as being applicable to Ecoregions 3E, 5E, 6E, and 7E (MNRF 2014).

From the GBIF dataset, there are a few observations of amphibians within the $RSA_{HRP-AQU}$ outside the AOI and LSA_{TER} during the breeding season (**Figure D-21**; **Table D-26**). These observations include eastern newt, four-toed salamander, gray treefrog, wood frog, and western chorus frog[15]. However, each location has only one species recorded, and the number of individuals and activity/habitat use was not provided.

For candidate SWH to be confirmed as SWH, the presence of a breeding population of one or more of the listed newt/salamander species, or two or more of the listed frog species with at least 20 individuals or calling in a full chorus, is required (OMNRF 2015). Candidate SWH areas, especially those with summer field observations of multiple amphibians (individuals and/or species), should be further investigated during the spring (March to June) to determine species presence, abundance, and habitat use.

4.3.7 Amphibian Breeding Habitat (Wetlands)

Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 1,070 polygons that matched 6E ECS criteria (**Figure D-22**, **Table E-1**). Most ecosite matches consisted of hardwood swamps, followed by mixedwood swamps and marshes; however, there were also numerous conifer swamp, shrub swamp, and lake/river ecosites, as well as two fen ecosites.

Of the 473 TEM plots assessed in the field, 262 (55.4%) were identified as candidate SWH, 15 (3.2%) were assigned as "unknown", and the remaining 196 (41.4%) were not considered suitable Amphibian Breeding Habitat (Wetlands) (although suitable habitat was observed outside one "not suitable" plot within the same polygon) (**Figure D-22**). Similar to Amphibian Breeding Habitat (Woodlands) (see Section 4.3.6), surveyors marked plots as "unknown" when the presence and longevity of vernal pooling/flooding was uncertain. A variety of amphibians of relevance to this SWH type were detected throughout the AOI and $RSA_{HRP-AQU}$ (outside the LSA_{TER}) during 2022 field studies. Green frogs were most commonly observed; other species included American toad, gray treefrog, eastern newt, and unknown frog and amphibian species. eDNA metabarcoding analyses also identified four-toed salamander and eastern newt in various aquatic habitats within the AOI and/or LSA_{AQU} during summer and/or fall (see Section 4.2.3 in Appendix E, Chapter 1).

Of note, "numerous" green frogs were observed in hardwood swamp habitat in the northwestern portion of the GSWC west of Cunningham Lake (**Figure D-22**; **Table D-27**). The field crew noted that the plot was inundated with water at the time of survey in early August, when green frogs may still be breeding (Ontario Nature 2023). In addition, a "large amount of" frogs, including American bullfrogs and other species, were observed adjacent to Schmidt Lake in early July. Surveyors noted that the habitat was "not a wetland, marshy and muddy, mature forest nearby". This observation suggests that Schmidt Lake may provide important amphibian breeding habitat, with potential Amphibian Movement Corridors (Section 4.5.1) leading away from the lake. The notable locations with tadpoles (unidentified species) and vernal pools, as described in Section 4.3.6, are also relevant to Amphibian Breeding Habitat (Wetlands).

From the GBIF dataset, there are a few observations of amphibians within the $RSA_{HRP-AQU}$ outside the AOI and LSA_{TER} during the breeding season (**Figure D-22**; **Table D-28**). These observations include eastern newt, eastern red-backed salamander, four-toed salamander, American bullfrog, gray treefrog, green

[15] Western chorus frog is not listed under SARO; however, the Great Lakes / St. Lawrence – Canadian Shield population, which is relevant to the SON-South Bruce siting area, is listed as Threatened under Schedule 1 of *SARA* and by COSEWIC.

frog, northern leopard frog, wood frog, and western chorus frog. However, each location has only one species recorded, and the number of individuals and activity/habitat use was not provided.

The same criteria for confirming Amphibian Breeding Habitat (Woodlands) SWH apply to Wetlands (OMNRF 2015). Candidate SWH areas, especially those with field observations of multiple amphibians (individuals and/or species), should be further investigated during the spring (March to June) to determine species presence, abundance, and habitat use.

4.3.8 Woodland Area-Sensitive Bird Breeding Habitat

Out of 925 ecosites mapped within the RSA_{AVI}, Zoetica's desk-based analyses found 445 ecosites that matched 6E ECS criteria (**Figure D-23**, **Table E-1**). Ecosite matches were fairly evenly spread between hardwood and mixedwood forests and swamps, followed by conifer forests and swamps.

Of the 169 TEM plots within the RSA_{AVI} assessed in the field, 74 (43.8%) were identified as candidate SWH, 7.1 (6.6%) were assigned as "unknown", and the remaining 83 (49.1%) were not considered suitable Woodland Area-Sensitive Bird Breeding Habitat (**Figure D-23**). However, surveyors noted for four "not suitable" plots that there may be suitable interior forested habitat elsewhere in the polygon. Field surveyors identified 32 candidate SWH plots within the AOI. However, the presence of three or more nesting/breeding pairs of the species listed in the 6E ECS is considered SWH (OMNRF 2015). Therefore, suitable habitats of non-optimal size should remain as candidate SWH and be further investigated in the spring and early summer for active nesting. Most "unknown" plots indicated a need for desk-based analysis of interior habitat area size.

Incidental observations of woodland area-sensitive bird species were uncommon during the 2022 field studies. Yellow-bellied sapsucker and pileated woodpecker[16] were observed at three locations within the AOI (**Figure D-23**; **Table D-29**). All three woodpecker observations were made in mixedwood forest ecosites; two of these polygons were also marked as candidate SWH. Within the LSA_{TER} outside the AOI, blue-headed vireo and red-breasted nuthatch were observed at three locations within 400 m of each other along the Teeswater River. These TEM plots (hardwood, mixedwood, and conifer forest ecosites) were considered candidate or "unknown" SWH. Finally, within the RSA_{AVI} outside the LSA_{TER}, red-breasted nuthatch was recorded twice near Oppleck Lake, with surrounding plots in the hardwood and conifer ecosites considered candidate SWH. Yellow-bellied sapsucker was recorded once northeast of the LSA_{TER} in a hardwood swamp ecosite considered "unknown" candidate SWH (**Figure D-23**; **Table D-29**). eDNA metabarcoding analyses also identified red-breasted nuthatch within the LSA_{AQU} (the portion that overlaps the RSA_{AVI}) during the summer (see Section 4.2.4 in Appendix E, Chapter 1).

From the GBIF dataset, there were breeding season observations of ovenbird, yellow-bellied sapsucker, and red-breasted nuthatch within the AOI and LSA_{TER}. However, field surveyors in 2022 either did not visit the areas/polygons as the locations were inaccessible and/or outside natural/naturalized ecosites, or the polygons were determined not to be candidate SWH as they did not meet the 6E ECS habitat criteria for Woodland Area-Sensitive Bird Breeding Habitat. Other woodland area-sensitive breeding bird species have been observed within the RSA_{AVI} outside the AOI and LSA_{TER}, including Canada warbler (Special Concern), black-throated blue warbler, blackburnian warbler, northern parula, and veery (**Figure D-23**; **Table D-30**). Most of these GBIF records were of single individuals; however, the area (consisting of

[16] Although pileated woodpecker is not listed in the 6E ECS, this species is included in the SWHMiST for Woodland Area-Sensitive Bird Breeding Habitat, which is indicated as being applicable to Ecoregions 6E and 7E (MNRF 2014).

hardwood and conifer forest ecosites) south of the LSA_{TER} included groups of 1-6 individuals from 10 species and could be important bird breeding habitat. However, it is unclear if any of these observations include active nests or confirmation of breeding (as GBIF records do not contain such information).

4.4 Habitat for Species of Conservation Concern

4.4.1 Marsh Bird Breeding Habitat

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found 1,097 polygons that matched 6E ECS criteria (**Figure D-24**, **Table E-1**). Most ecosite matches consisted of hardwood swamps, followed by mixedwood swamps and marshes; however, there were also numerous conifer swamp, meadow, and shrub swamp ecosites.

Of the 473 TEM plots assessed in the field, 26 (5.5%) were identified as candidate SWH, four (0.8%) were assigned as "unknown", and the remaining 443 (93.7%) were not considered suitable Marsh Bird Breeding Habitat (although suitable habitat was observed outside one "not suitable" polygon) (**Figure D-24**). Ten candidate SWH plots were identified in marsh, mixedwood swamp, and shrub swamp ecosites within the AOI. Surveyors noted whether the habitat was suitable for a variety of marsh/wetland breeding bird species or for selected species.

Three marsh bird species were observed during 2022 field studies (**Figure D-24**; **Table D-31**). Green herons were recorded in multiple locations within the AOI and $RSA_{AVI-AQU}$ (but not the LSA_{TER}). Green heron observations were also discussed for Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs) (Section 4.1.10). Within the $RSA_{AVI-AQU}$, a pair of sandhill cranes was observed in a marsh ecosite (candidate SWH plot) along Schmidt Creek within the GSWC.[17] To the west, near Cunningham Lake, Virginia rails were recorded vocalizing at two locations. Field surveyors noted that the species was presumably breeding within the marsh ecosite (also a candidate SWH plot). eDNA metabarcoding analyses also identified Virginia rail within the LSA_{AQU} during the summer (see Section 4.2.4 in Appendix E, Chapter 1). In addition, three sandhill cranes were incidentally observed flying overhead at a tributary of Alps Creek south of the AOI. The field crew noted the wetland (marsh ecosite) as a possible sandhill crane nesting area.

The NHIC has mapped an EO for least bittern (threatened) in the general vicinity of Clam Lake in the $RSA_{AVI-AQU}$. However, the last observation of this species was in 1980 and this record has been designated as a "Historical" EO by the NHIC. From the GBIF dataset, a variety of marsh breeding birds have been observed within the $RSA_{AVI-AQU}$ outside the AOI and LSA_{TER} during the breeding season (**Figure D-24**; **Table D-32**). These observations include black tern (Special Concern), red-necked grebe (provincially rare), common loon, green heron, pied-billed grebe, sandhill crane, sedge wren, sora, Virginia rail, lesser scaup, northern shoveler, ring-necked duck, and solitary sandpiper.[18] Notable locations with more than five species observed occurred south of Clam Lake (including the single observation of black tern) and at Schmidt Lake. It is unclear if any of these observations include active nests or confirmation of breeding (as GBIF records do not contain such information).

[17] The map figure (**Figure D-24**) presents two observations of sandhill cranes; however, they were recorded on the same date and are likely duplicates recorded by different surveyors.

[18] Although red-necked grebe, lesser scaup, northern shoveler, ring-necked duck, and solitary sandpiper are not listed in the 6E ECS, these species are included in the SWHMiST for Marsh Bird Breeding Habitat, which is indicated as being applicable to All of Ontario (MNRF 2014).

For candidate SWH to be confirmed as SWH, the presence of one or more nesting pairs of sandhill crane, black tern, or green heron, or breeding by any combination of five or more of the listed species, is required (OMNRF 2015).[7] Candidate SWH areas and "unknown" plots should be surveyed during May/June when birds are actively nesting.

4.4.2 Open Country Bird Breeding Habitat

Out of 2,155 ecosites mapped within the $RSA_{AVI-AQU}$, Zoetica's desk-based analyses found one polygon that matched 6E ECS criteria: a meadow ecosite southeast of Clam Lake (**Figure D-25**, **Table E-1**). As this polygon is located outside the RSA_{AVI}, the candidate SWH would only be suitable for upland sandpiper (provincially rare), a shorebird species, for the purposes of the BIS.

Of the 473 TEM plots assessed in the field, one (0.2%) was identified as candidate SWH, four (0.8%) were assigned as "unknown", and the remaining 468 (98.9%) were not considered suitable Open Country Bird Breeding Habitat (**Figure D-25**). However, one "not suitable" plot was indicated as being adjacent to appropriate upland habitat. The single candidate SWH plot is in a meadow adjacent to the Teeswater River within the AOI; the surveyor noted that it is likely suitable habitat for vesper sparrow.

There were only three observations of open country bird species during the 2022 field studies, all occurring in mid-late August: bobolink (Threatened) and eastern meadowlark (Threatened) were incidentally observed in agricultural fields (corn/pasture and alfalfa, respectively) and a heavily vegetated meadow within the AOI and/or LSA_{TER} (**Figure D-25**; **Table D-33**). eDNA metabarcoding analyses also revealed the presence of savannah sparrow within the AOI during the summer (see Section 4.2.4 in Appendix E, Chapter 1). During previous preliminary environmental studies for the Project in 2020, suitable habitat for eastern meadowlark and bobolink was found in agricultural fields adjacent to the NWMO's borehole sites BH-01 and BH-02, located within the AOI (Tulloch Environmental 2020, 2021).

From the GBIF dataset, a variety of open country species have been observed during the nesting season within the AOI, LSA_{TER}, RSA_{AVI}, and $RSA_{AVI-AQU}$ (which only applies to upland sandpiper) (**Figure D-25**; **Table D-34**). These observations include eastern meadowlark, bobolink, grasshopper sparrow (Special Concern), upland sandpiper, savannah sparrow, vesper sparrow, northern harrier, American kestrel, and horned lark.[19] Of these species, eastern meadowlark, bobolink, and upland sandpiper have been reported within the AOI. It is unclear if any of these observations include active nests or confirmation of breeding (as GBIF records do not contain such information). However, the NHIC has also mapped EOs for eastern meadowlark and bobolink within the RSA_{AVI}. As SAR, their habitats are protected under the Ontario *ESA* rather than classified as SWH. Eastern meadowlark and bobolink are discussed in more detail in Upland Breeding Bird Species of Conservation Concern (Section 2.3.2.1, Chapter 7).

For candidate SWH to be confirmed as SWH, the presence of two or more nesting/breeding pairs of the listed species is required (OMNRF 2015). Candidate SWH areas and "unknown" plots should be surveyed during the spring and early summer when birds are singing and defending their territories.

[19] Although American kestrel and horned lark are not listed in the 6E ECS, these species are included in the SWHMiST for Open Country Bird Breeding Habitat, which is indicated as being applicable to All of Ontario (MNRF 2014).

4.4.3 Shrub/Early Successional Bird Breeding Habitat

Out of 925 ecosites mapped within the RSA_{AVI}, Zoetica's desk-based analyses found one shrub ecosite that matched 6E ECS criteria (**Figure D-26**, **Table E-1**).

Of the 169 TEM plots within the RSA_{AVI} assessed in the field, one (0.6%) was identified as candidate SWH, eight (4.7%) were assigned as "unknown", and the remaining 160 (94.7%) were not considered suitable Shrub/Early Successional Bird Breeding Habitat (**Figure D-26**). The single candidate SWH plot and three "unknown" plots are located within the AOI. The candidate SWH is located in a hardwood forest ecosite where surveyors noted an abundance of willow shrubs. There were four observations of shrub/early successional bird species during the 2022 field studies, all occurring in mid-August: house wren and northern cardinal were heard at plots within 200 m of each other along the Teeswater River in the southeast portion of the LSA_{TER} (outside the AOI), and eastern towhees were heard at and near a plot within the RSA_{AVI} to the northeast of the LSA_{TER} (**Figure D-26**; **Table D-35**). The eastern towhee observations were in aspen and sugar maple hardwood treed habitats, which the surveyors noted as potentially suitable Shrub/Early Successional Bird Breeding Habitat. The mixedwood forest ecosite where the house wren was observed was marked as "unknown" candidate SWH; however, the hardwood forest ecosite with the northern cardinal was not considered candidate SWH as it did not meet the 6E ECS habitat criteria.

Surveyors also noted gray catbird at four plots; although this species is indicated in the *Significant Wildlife Habitat Technical Guide* (OMNR 2000) as utilizing thickets and second growth habitats, it is not listed in the 6E ECS nor the SWHMiST (MNRF 2014) as part of the defining criteria for Shrub/Early Successional Bird Breeding Habitat SWH. From the GBIF dataset, a variety of shrub/early successional breeding bird species have been recorded within the AOI, LSA_{TER}, and RSA_{AVI} (**Figure D-26**; **Table D-36**). These observations include brown thrasher and clay-colored sparrow (the two indicator species noted in 6E ECS), eastern whip-poor-will (Threatened), eastern towhee, field sparrow, black-billed cuckoo, willow flycatcher, palm warbler, blue-winged warbler, house wren, northern cardinal, and yellow-billed cuckoo.[20]

For candidate SWH to be confirmed as SWH, the presence of nesting or breeding of one of the indicator species and at least two of the "common species" listed in 6E ECS is required (OMNRF 2015).[7] Notable observations from the GBIF dataset that may meet this multi-species requirement occur at two locations: one is close to the northern boundary of the RSA_{AVI} outside of mapped ecosites but near hardwood swamp habitat where clay-colored sparrow, black-billed cuckoo, and field sparrow were observed; the other is south of the LSA_{TER} in/near a conifer forest ecosite where brown thrasher and six other species have been observed (**Figure D-26**). However, it is unclear if any of these observations include active nests or confirmation of breeding (as GBIF records do not contain such information). Candidate SWH areas and "unknown" plots should be surveyed during the spring and early summer when birds are singing and defending their territories.

4.4.4 Terrestrial Crayfish

Out of 2,128 ecosites mapped within the LSA_{AQU}, Zoetica's desk-based analyses found 992 polygons that matched 6E ECS criteria (**Figure D-27**, **Table E-1**). Ecosite matches were primarily hardwood swamps,

[20] Although palm warbler, blue-winged warbler, house wren, northern cardinal, and yellow-billed cuckoo are not listed in the 6E ECS, these species are included in the SWHMiST for Shrub/Early Successional Bird Breeding Habitat, which is indicated as being applicable to All of Ontario (MNRF 2014).

mixedwood swamps, and marshes; however, there were also numerous shrub swamp and meadow ecosites.

Of the 473 TEM plots within the LSA_{AQU} assessed in the field, 60 (12.7%) were identified as candidate SWH, 36 (7.6%) were assigned as "unknown", and the remaining 377 (79.7%) were not considered suitable Terrestrial Crayfish habitat (**Figure D-27**). Of the 60 candidate SWH plots identified in total, 14 were located within the AOI in a variety of habitats (marsh, hardwood swamp, mixedwood swamp, conifer swamp). Surveyors typically marked plots as "unknown" when moist soil conditions suggested suitable habitat, even if terrestrial crayfish chimneys or burrows were not observed within the plot (but may have been detected nearby). Furthermore, surveyors marked six plots as "not suitable" but observed chimneys while in transit outside the plot/polygon or on adjacent polygons.

Terrestrial crayfish chimneys or burrows were observed throughout the LSA_{AQU}, including at 10 locations across the AOI (**Figure D-27**; **Table D-37**).[21] Many observations correspond with candidate SWH plots; however, there are a few discrepancies due to detections of chimneys/burrows while field teams were in transit and not on the survey plot. Overall, two observations were identified to digger crayfish and three were attributed to the Great Plains mudbug (previously known as devil crayfish); however, most detections could not be identified to the species level. Terrestrial crayfish individuals were also observed at four locations in the GSWC, primarily on the eastern side where incidental observations and candidate SWH plots were concentrated. In addition, eDNA metabarcoding analyses identified digger crayfish at one location within the AOI and two within the GSWC (see Figure I-1 in Appendix E, Chapter 1).

Meadow marsh or swamp ecosites (or ecoelements) with the presence of one or more terrestrial crayfish individuals or their chimneys/burrows are confirmed SWH (OMNRF 2015). Therefore, the locations of all terrestrial crayfish observations from the 2022 field studies are considered SWH, though the area boundaries may need to be confirmed. Additional field work should also be conducted to confirm the presence of terrestrial crayfish at "unknown" plots.

4.4.5 Special Concern and Rare Wildlife Species

A total of 39 Special Concern and Rare Wildlife Species – including 12 vegetation species, two reptiles, 22 birds, and three invertebrates – have been observed within the BIS study areas (**Table 4-2**). Of these species, nine have been detected within the AOI, 13 within the LSA_{TER} or LSA_{AQU} outside the AOI, and 16 within their BV-specific RSAs outside the AOI and LSAs. These Special Concern and Rare species observations are discussed below, generally in order of decreasing data quality with respect to identification of candidate SWH. Mapped data are discussed in the Species of Conservation Concern section of the applicable BV chapter of the 2023 BIS Baseline Report.

- **2022 Tier 1 BIS baseline studies**: There were incidental field observations of eight Special Concern (green dragon, eastern ribbonsnake, snapping turtle, monarch, barn swallow, eastern wood-pewee, wood thrush, and bald eagle) and two provincially rare species (eastern green-violet and terrestrial crayfish) within their applicable BIS study areas in 2022. Wood thrush was detected twice within the AOI: once as an incidental field observation, the other through eDNA metabarcoding analyses (see Section 4.1.4 in Appendix E, Chapter 1). Eastern ribbonsnake and bald eagle each had only one observation, both within the GSWC. None of these uncommon detections suggested that important

[21] Some terrestrial crayfish chimneys/burrows observed during TEM/SWH surveys were documented in more detail on separate incidental observations data forms. Duplicate observations have not been removed from **Figure D-27**.

habitat for the species was present. However, notable observations with details about wildlife activity/behaviour, local vegetation populations, or other important habitat features – which may warrant review by NHIC as candidate EOs and SWH – include the following:

- Terrestrial crayfish – please refer to Terrestrial Crayfish (Section 4.4.4) for a discussion of pertinent 2022 field observations.
- Snapping turtle – please refer to Turtle Wintering Areas (Section 4.1.7) and Turtle Nesting Areas (Section 4.3.4) for a discussion of pertinent 2022 field observations.
- Eastern green-violet was observed at two locations in sugar maple forests within the AOI; surveyors indicated that thousands of individuals (some fruiting) were present at both sites. At one location close to the Teeswater River in the northern portion of the AOI, the surveyor noted that "This might represent one of the largest [occurrences] in Ontario". These observations should be reported to NHIC and will likely constitute SWH.
- Barn swallows were observed at nine locations throughout the AOI (a few in close proximity) between July 18 and September 30. At a property within the southern AOI, surveyors observed 20 birds (a mix of adults and juveniles) feeding overhead and noted that barn swallows were present and nesting in the old barn. In addition, 25 adult barn swallows were observed feeding and flying around another barn within the AOI; it is possible that birds are/were nesting in this building. Confirmed breeding habitats and nest sites should constitute SWH.
- Eastern wood-pewees were observed (primarily through audio cues) throughout the AOI, LSA_{TER}, and RSA_{AVI} between July 7 and August 31. Birds were commonly found in hardwood and mixedwood forests and swamps, often adjacent to agricultural fields. Within the AOI and LSA_{TER}, pairs of male eastern wood-pewees were recorded calling at three locations in deciduous forest/swamp habitats, one bird was "heard consistently calling" in a sugar maple forest, and another was described as "singing" in a treed swamp. Within the RSA_{AVI} outside the LSA_{TER}, observations of two or more birds occurred at four locations, including counter-calling of three individuals in a maple forest north of Concession Road 10. Although no eastern wood-pewee nests or other indicators of confirmed or probable breeding were noted by surveyors, birds calling during the nesting season may indicate important breeding habitat in the area, and additional targeted breeding bird surveys should be conducted to identify candidate and confirmed SWH.
- Green dragon was observed at two locations (one amongst riparian shrubs, one within cedar stands) along Alps Creek within the LSA_{AQU} south of the AOI. Both observations were of a single fruiting individual. It is unlikely that a single individual would be considered an EO by the NHIC (and thus SWH); however, further field investigations of the area may be warranted.
- Monarch butterflies were observed throughout the AOI between July 13 and September 29. In the field, groups of 1-7 individuals of various ages (egg, larva including third and fourth instar, adult) were observed. Most individuals were recorded as feeding; these locations were primarily in agricultural (soybean and alfalfa) fields and meadow marshes, with milkweed and joe pye weed specifically noted. Other monarchs were recorded as travelling and resting, and there was one observation of a breeding pair. The NHIC currently only tracks significant

migratory staging areas for monarchs (i.e., "enduring migration aggregations" with "enough individuals" as noted in existing NHIC records). Therefore, these monarch field observations in 2022 are likely insufficient to be classified as an EO or candidate SWH. However, given that field surveyors recorded some observations of feeding and resting adult butterflies in the fall, further field investigations of potentially suitable habitats within the AOI may be warranted.

- **NHIC dataset**: There are EOs for rigid sedge, beaked spikerush, greater round-leaved orchid, and snapping turtle within the AOI and BV-specific LSAs and RSAs. Beaked spikerush was last observed in 1976 and rigid sedge and greater round-leaved orchid were last observed in 1987; these EOs have been designated as "Historical" by the NHIC. The EO for snapping turtle is "Verified extant (viability not assessed)", as previously discussed in Turtle Wintering Areas (Section 4.1.7). Detailed field studies are needed to delineate the ELC ecosites that protect the species' habitat form and function; these ecosites would become confirmed SWH.

- **Greenock Swamp ANSI report**: The Greenock Swamp Area of Natural and Scientific Interest (ANSI) Life Science Inventory report identified five provincially rare aquatic, wetland, or riparian vegetation species within the Greenock Swamp ANSI (i.e., within the LSA_{AQU} outside the AOI): Hill's pondweed, rigid sedge, beaked spikerush, greater round-leaved orchid, and green arrow arum (Johnson 1994). Appendix F of this ANSI report presents a "Rare Vascular Plant Atlas" that describes one or more populations of each species, which may include hundreds or thousands of fruiting individuals. The NHIC has not mined and mapped these inventory findings as EOs due to lack of time and resources, and their general prioritization of Endangered and Threatened species. Nevertheless, the rare vegetation descriptions in the Greenock Swamp ANSI report provide evidence of strong candidate SWH.

- **Previous 2020 preliminary environmental studies for the Project**: A reconnaissance for natural heritage features was conducted in July 2020 for borehole BH-01 (Tulloch Environmental 2020) and in October 2020 for borehole BH-02 (Tulloch Environmental 2021) within the AOI. At BH-01, nesting barn swallows were observed within farmstead out-buildings on site. At BH-02, no active or recently active barn swallow nests were found, but suitable habitat exists within/around the buildings on site. Along with the 2022 Tier 1 BIS incidental field observations of barn swallows (described above), these findings provide support for confirmed SWH.

- **GBIF dataset**: There are existing observations of seven Special Concern or provincially rare vegetation species, two reptiles, 22 birds (10 upland breeding birds, one shorebird, 10 waterbirds, one raptor), and one invertebrate. Except for Bush's pocket moss, which has been observed within the LSA_{TER} outside the AOI, all other GBIF observations of rare vegetation occurred in the GSWC within the LSA_{AQU}. All GBIF records of Special Concern and rare vegetation species are of preserved specimens collected in 1977 or 1987. Either a single individual was collected, or the number was not specified, and there are no additional notes about the potential occurrence of a local viable population. Similarly, GBIF records for more mobile and wider-ranging species (e.g., birds, reptiles) rarely provide additional information about species habitat use. As such, the potential importance of the habitats within which the species were observed, with respect to identifying candidate or confirmed SWH, is difficult to ascertain. These Special Concern and Rare Wildlife Species will not be further described in this SWH appendix; however, details regarding their presence and distribution

from current and historical records are provided within the corresponding BV chapters of the 2023 BIS Baseline Report.

Further field studies are needed to verify the presence and distribution of Special Concern and provincially rare species throughout applicable BIS study areas, to confirm breeding (or probable breeding) of wildlife species, and to assess the area needed to protect the habitat form and function for the species in order to define the SWH (OMNRF 2015).

Table 4-2. Ontario Special Concern and Rare Wildlife Species with desk-based and/or field-based observations within the BIS study areas.

Biodiversity Value[1]	**Common Name**	**SARO Status or Provincial Rarity**[2]	**BV-Specific Study Area(s) with Detections**	**Data Source(s)**[3]
Vegetation (aquatic; N/A)	Floating Crystalwort	S3	LSA_{AQU}	GBIF
Vegetation (aquatic; OBL)	Beaked Spikerush	S3	LSA_{AQU}	NHIC, ANSI, GBIF
Vegetation (aquatic; OBL)	Green Arrow Arum	S3	LSA_{AQU}	ANSI
Vegetation (aquatic; OBL)	Hill's Pondweed	Special Concern	LSA_{AQU}	GBIF, ANSI
Vegetation (terrestrial; FACU)	Eastern Green-violet	S2	AOI	Field
Vegetation (terrestrial; N/A)	Bush's Pocket Moss	S3	LSA_{TER}	GBIF
Vegetation (wetland/riparian; FAC)	Greater Round-leaved Orchid	S2	LSA_{AQU}	NHIC, ANSI
Vegetation (wetland/riparian; FAC)	Slender Mountain-mint	S3	LSA_{AQU}	GBIF
Vegetation (wetland/riparian; FACW)	Green Dragon	Special Concern	LSA_{AQU}	Field
Vegetation (wetland/riparian; FACW)	Rigid Sedge	S3?	LSA_{AQU}	NHIC, ANSI
Vegetation (wetland/riparian; FACW)	Tubercled Orchid	S3	LSA_{AQU}	GBIF
Vegetation (wetland/riparian; N/A)	Large-leaved Leafy Moss	S3	LSA_{AQU}	GBIF
Reptiles	Eastern Ribbonsnake	Special Concern	$RSA_{HRP\text{-}AQU}$	GBIF, Field
Reptiles	Snapping Turtle	Special Concern	AOI, LSA_{TER}, $RSA_{HRP\text{-}AQU}$	NHIC, GBIF, Field
Terrestrial Invertebrates	Monarch	Special Concern	AOI	Field
Upland Breeding Birds	Barn Swallow	Special Concern	AOI, LSA_{TER}, RSA_{AVI}	GBIF, Field
Upland Breeding Birds	Canada Warbler	Special Concern	RSA_{AVI}	GBIF
Upland Breeding Birds	Common Nighthawk	Special Concern	RSA_{AVI}	GBIF

Biodiversity Value[1]	Common Name	SARO Status or Provincial Rarity[2]	BV-Specific Study Area(s) with Detections	Data Source(s)[3]
Upland Breeding Birds	Eastern Wood-pewee	Special Concern	AOI, LSA_{TER}, RSA_{AVI}	GBIF, Field
Upland Breeding Birds	Evening Grosbeak	Special Concern	RSA_{AVI}	GBIF
Upland Breeding Birds	Fox Sparrow	S5B,S3N	RSA_{AVI}	GBIF
Upland Breeding Birds	Grasshopper Sparrow	Special Concern	RSA_{AVI}	GBIF
Upland Breeding Birds	Rusty Blackbird	Special Concern	RSA_{AVI}	GBIF
Upland Breeding Birds	White-crowned Sparrow	S5B,S3N	RSA_{AVI}	GBIF
Upland Breeding Birds	Wood Thrush	Special Concern	AOI, LSA_{TER}, RSA_{AVI}	GBIF, Field, eDNA
Shorebirds	Upland Sandpiper	S2B	AOI, $RSA_{AVI-AQU}$	GBIF
Waterbirds	Black Tern	Special Concern	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Blue-winged Teal	S3B,S4M	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Canvasback	S1B,S3N,S4M	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Caspian Tern	S3B,S5M	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Great Black-backed Gull	S1B,S4N	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Great Egret	S2B,S3M	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Greater White-fronted Goose	S3M	LSA_{TER}, $RSA_{AVI-AQU}$	GBIF
Waterbirds	Horned Grebe	Special Concern	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Red-necked Grebe	S3	$RSA_{AVI-AQU}$	GBIF
Waterbirds	Tundra Swan	S2B,S4N,S3M	LSA_{TER}, $RSA_{AVI-AQU}$	GBIF
Raptors	Bald Eagle	Special Concern	AOI, LSA_{TER}, $RSA_{AVI-AQU}$	GBIF, Field
Primary and Secondary Producers	Terrestrial Crayfish[4]	S3	AOI, LSA_{AQU}	Field, eDNA
Primary and Secondary Producers	River Bluet	S3	LSA_{TER}	GBIF

Notes:

1. For the purposes of the 2023 BIS Baseline Report, vegetation species are categorized by their habitat to determine the appropriate study area. Aquatic (OBL) and wetland/riparian (FACW, FAC) species are studied to the LSA_{AQU}, while terrestrial (FACU, UPL) species are studied to the LSA_{TER}. Wetland indicator statuses are available for vascular vegetation only: OBL = Obligate, FACW = Facultative Wetland, FAC = Facultative, FACU = Facultative Upland, UPL = Upland.

Biodiversity Value[1]	Common Name	SARO Status or Provincial Rarity[2]	BV-Specific Study Area(s) with Detections	Data Source(s)[3]

2. Conservation status ranks: SC = Special Concern; S1 = Critically Imperiled, S2 = Imperiled, S3 = Vulnerable, S4 = Apparently Secure, S5 = Secure. B (Breeding), N (Non-breeding), and M (migrant) are breeding status modifiers.
3. "eDNA" as a data source refers to the Tier 1 eDNA metabarcoding studies (see Appendix E, Chapter 1), which is the use of eDNA in combination with metabarcoding for multi-species identification.
4. Terrestrial crayfish observations within the AOI include digger crayfish (*Creaserinus fodiens*) and unidentified species. Both species listed in the 6E ECS – digger crayfish and devil crayfish (since renamed as Great Plains mudbug, *Lacunicambarus nebrascensis*) – are provincially rare (S3).

4.5 Animal Movement Corridors

4.5.1 Amphibian Movement Corridors

Amphibian Movement Corridors may be found in all ecosites associated with water but must be determined when Amphibian Breeding Habitat (Wetlands) is confirmed as SWH (OMNRF 2015). Out of 2,155 ecosites mapped within the $RSA_{HRP-AQU}$, Zoetica's desk-based analyses found 1,664 polygons that matched 6E ECS criteria (**Figure D-28**, **Table E-1**). Ecosite matches for this SWH type were the same as for Amphibian Breeding Habitat (Woodland) (see Section 4.3.6).

Of the 473 TEM plots assessed in the field, 217 (45.9%) were identified as candidate SWH, 113 (23.9%) were assigned as "unknown", and the remaining 143 (30.2%) were not considered suitable Amphibian Movement Corridors (**Figure D-28**). Some plots were marked "not suitable" as corridor habitat because they were likely to be amphibian breeding habitat instead. Field notes for the majority of "unknown" plots indicated (correctly) that amphibian surveys are needed, and breeding habitat needs to be confirmed as SWH first. However, supplementary information for the plots marked as candidate SWH will also be useful for designing or prioritizing future amphibian studies, as field surveyors noted the extent and quality of connectivity between vernal pools.

A variety of amphibians were detected throughout the AOI, LSA_{TER}, and $RSA_{HRP-AQU}$ during 2022 field studies (**Figure D-28**; **Table D-38**). In addition to species and notable observations already described for Amphibian Breeding Habitat SWH (Woodland and Wetlands; Sections 4.3.6 and 4.3.7), surveyors reported American bullfrog, eastern red-backed salamander, northern leopard frog, pickerel frog, unidentified *Lithobates* frogs (e.g., northern leopard frog, pickerel frog, or green frog), and an unidentified salamander. Many observations were noted by surveyors as supporting candidate Amphibian Movement Corridors based on the habitat (i.e., away from potential breeding ponds) and/or "travelling" frogs and toads. "Lots of leopard frogs" were observed at a stream in the northwestern portion of the AOI in early October 2022, the same location where unidentified frogs and tadpoles were observed earlier in July. However, the northern leopard frog observation is relatively late in the season and may suggest an overwintering site rather than a movement corridor. From the GBIF dataset, there is one notable record of 49 green frogs within the $RSA_{HRP-AQU}$ outside the AOI and LSA_{TER} (**Figure D-28**; **Table D-39**). However, as these frogs were observed in Formosa Creek, and green frogs may breed as late as August (Ontario Nature 2023) this area may be a potential amphibian breeding habitat instead.

4.5.2 Deer Movement Corridors

Deer Movement Corridors may be found in all forested ecosites but must be determined when deer wintering habitat is confirmed as SWH (OMNRF 2015). Out of 1,260 ecosites mapped within the RSA_{UNG}, Zoetica's desk-based analyses found 928 polygons that matched 6E ECS criteria (**Figure D-29**, **Table E-1**).

Most ecosite matches consisted of hardwood forests and swamps, followed by mixedwood forests and swamps and, to a lesser extent, conifer forests and swamps.

Of the 213 TEM plots within the RSA_{UNG} assessed in the field, 197 (92.5%) were assigned as "unknown" and the remaining 16 (7.5%) were not considered suitable Deer Movement Corridors (**Figure D-29**). Similar to Deer Yarding Areas (Section 4.1.12) and Deer Winter Congregation Areas (Section 4.1.13), surveyors noted that MNRF is responsible for determining and mapping this SWH type. Nonetheless, for many plots marked as candidate SWH or "unknown", surveyors also provided brief but useful descriptions of the habitat, incidental observations of white-tailed deer sign, and evidence of being in a deer hunting area. Incidental deer observations were common throughout the AOI, LSA_{TER}, and RSA_{UNG} (see **Figure D-20** for Seeps and Springs SWH); however, these observations were not considered relevant to Deer Movement Corridors due to the summer and early fall (early July to mid-October) survey timing.

Based on the MNRF's Wildlife Values Area dataset, there are currently no White-tailed Deer Migration Routes identified within the AOI, LSA_{TER}, and RSA_{UNG} and, thus, Deer Movement Corridors are assumed to be absent. Future discussions with MNRF (e.g., as part of ongoing stakeholder and rights-holder engagement) may indicate that suitable habitats for Deer Movement Corridors (e.g., "yes" and "unknown" plots) should be further investigated.

5.0 DISCUSSION

This 2023 SWH baseline report focused on updating candidate SWH mapping with 2022 Tier 1 BIS field data, while retaining the desk-based species observations and habitat data previously reported in 2022. Out of the 39 SWH types from the 6E ECS (OMNRF 2015) that were deemed relevant to the SON-South Bruce siting area (see Section 1.0), Zoetica's analyses revealed confirmed or candidate SWH within the AOI, LSA_{TER} or LSA_{AQU}, and/or BV-specific RSAs for 27 SWH types, including:

- 11 seasonal concentration areas
- 2 rare vegetation communities
- 8 specialized habitats for wildlife
- 5 habitats for species of conservation concern
- 1 animal movement corridor

Based on information available to date, candidate SWH was not found or unlikely to be present for six SWH types, including Bat Hibernacula, Deer Yarding Areas, Cliff and Talus Slopes, Sand Barren, Savannah, and Tallgrass Prairie. There may be Other Rare Vegetation Communities present; however, further discussions with NHIC and MNRF are needed.

5.1 Confirmed Significant Wildlife Habitat

To date, four types of confirmed SWH have been identified: Deer Winter Congregation Areas, Seeps and Springs, Terrestrial Crayfish, and habitat for barn swallow (Special Concern).

The MNRF-mapped Deer Wintering Area (equivalent to Deer Winter Congregation Area SWH) that overlaps the GSWC occurs within the RSA_{UNG} and extends into the LSA_{TER} outside the AOI (**Figure D-13**). According to the 6E ECS, all woodlots exceeding the >100 ha minimum size criteria are significant unless determined not be significant by MNRF (OMNRF 2015). Therefore, engagement with MNRF staff is needed to clarify if their mapped polygon, especially in areas potentially impacted by the Project (i.e., LSA_{TER}), is considered significant overwintering habitat for white-tailed deer. Until further information is available from MNRF, the current mapped polygon will be considered confirmed SWH for the purposes of the BIS.

During 2022 TEM field studies, surveyors identified 31 candidate Seeps and Springs throughout the BIS study areas, including at five plots within the AOI (**Figure D-20**). Additional seeps and springs were identified within the AOI and LSA_{AQU} during AHM surveys (see Figure E-1 in Appendix D, Chapter 1). These AHM findings included two areas (one in the AOI, the other in the LSA_{TER}) with two or more seeps and/or springs; at least one of these areas meets the criteria for confirmed SWH (OMNRF 2015). Furthermore, although the number of individual seeps or springs were not systematically recorded in the field during TEM/SWH surveys, some observations indicated the presence of "some" or "many" seeps or springs in swampy depressions. These and other candidate SWH areas should be further investigated on the ground to confirm the number of seeps/springs present.

Terrestrial crayfish chimneys or burrows were observed throughout the AOI and LSA_{AQU} during 2022 field studies (**Figure D-27**). According to the 6E ECS, the area of the ELC ecosite or an ecoelement area of meadow marsh or swamp within the larger ecosite area is the SWH (OMNRF 2015). Therefore, using a conservative approach, all ecosite polygons where terrestrial crayfish chimneys/burrows or individuals were observed should be considered SWH. In addition, surveyors marked "yes" or "unknown" candidate SWH where no chimneys or burrows were found on the plot (but may have been detected nearby), but

the habitat was deemed suitable for terrestrial crayfish (e.g., appropriate ecosite, moist soils, edges). These plots and polygons should be further investigated for the presence of terrestrial crayfish. Given the prevalence of incidental observations during 2022 field studies, it is likely that terrestrial crayfish are present in other parts of the AOI. Detailed field investigations for terrestrial crayfish (and other SWH types) will be needed when additional information about the Project footprint and construction activities is known.

Barn swallows were recently downlisted from Threatened to Special Concern in Ontario in January 2023; thus, their habitat protection changed from the Ontario *ESA* to the *Planning Act* and PPS (as SWH). Barn swallows were reported nesting in farm buildings within the AOI during both 2022 field studies and previous 2020 preliminary environmental studies (Tulloch Environmental 2020, 2021). Zoetica assumes that confirmed barn swallow nest sites would be designated as EOs by the NHIC; if so, SWH would be confirmed after mapping the exact location of the nest(s). Under the Ontario *ESA*, the General Habitat Description for Barn Swallow defined the area of habitat protected as the nest site (Category 1), the area within 5 m of the nest (Category 2), and the area between 5 m and 200 m of the nest (Category 3) (MECP 2013). Further discussions with NHIC and/or MNRF would be helpful to clarify if these habitat categories were carried forward to delineate SWH for barn swallows, since ELC mapping is likely not appropriate for this species.

5.2 Candidate Significant Wildlife Habitat

Mapped candidate SWH will be used to inform Tier 2 study design and prioritized for field verification. If the SON-South Bruce siting area is selected for the Project, detailed baseline field studies will be conducted to confirm SWH. Based on information available to date, there is strong evidence to support candidate SWH (i.e., more likely to become confirmed SWH), including within the AOI, for Bat Maternity Colonies and habitat for two Special Concern or Rare Wildlife Species: snapping turtle and eastern green-violet. Furthermore, SWH types related to amphibians are likely present within the BIS study areas for herpetofauna.

The Toronto Zoo NBCP's bat studies focused trap-and-release and radio-telemetry methods on Restricted Species M1 due to the importance of improving our collective understanding of a SAR and to inform conservation efforts to support the species' recovery strategy (Humphrey and Fotherby 2019). However, NBCP researchers also mist-netted seven "heavily pregnant" big brown bats during the exploratory trap-and-release program (Sparrow-Scinocca et al. 2022). Tagging and tracking some big brown bats, in addition to Restricted Species M1, may help identify additional Bat Maternity Colonies within the AOI, LSA_{TER}, and/or RSA_{BAT}. During 2022 Tier 1 BIS field studies, survey crews identified numerous cavity trees (potential bat roosting habitat) throughout the BIS study areas, including several locations with medium and high snag densities within the AOI (**Figure D-6**, **Table D-6**). Exit surveys and acoustic monitoring will focus on areas with high and medium snag densities within the AOI and LSA_{TER} to further investigate candidate Bat Maternity Colonies SWH (OMNR 2011a).

Important habitat for snapping turtle (Special Concern), and potentially Turtle Nesting Area and/or Turtle Wintering Area SWH, may occur throughout the BIS study areas and the SON-South Bruce siting area. The NHIC has delineated a very large EO for snapping turtle that overlaps the AOI, LSA_{TER}, and $RSA_{HRP\text{-}AQU}$. This EO is based on 169 observations throughout the counties of Bruce, Grey, Huron, Perth, and Wellington. Although the last observation was made in 2004, the NHIC still considers this EO as "Verified Extant" due to one or more observations being made in the last 20 years. Ground-truthing of the snapping turtle EO,

including areas identified as candidate SWH ecosites for Turtle Wintering Area (**Figure D-7**) and Turtle Nesting Area (**Figure D-19**), will help identify important habitats for snapping turtle.

TEM surveyors recorded thousands of eastern green-violet (provincially rare) individuals at two locations within the AOI during 2022 field studies (see Figure B-3c in Chapter 2). These large populations (one estimated as covering 15 m x 60 m and noted by the surveyor as possibly one of the largest in Ontario) were found on the slopes of sugar maple forests close to the Teeswater River or its tributary. Additional scattered individuals were observed outside of the main patches, including on a trail. One surveyor noted the observation as a range expansion of the species, since eastern green-violet is rare and local in rich moist floodplain woods in southwestern Ontario (Argus et al. 1987) and had not been previously recorded in the area. These observations should be reported to NHIC for review; if deemed an EO (or two EOs), SWH could be confirmed after detailed habitat mapping.

There are likely Amphibian Breeding Habitat (Woodland and/or Wetlands) and Amphibian Movement Corridors SWH within the $RSA_{HRP-AQU}$. Large groups of wood frogs (including juveniles), green frogs, American bullfrogs, and unidentified frogs were observed in the northern half of the GSWC during 2022 field studies (**Figure D-21**, **Figure D-22**, **Figure D-28**). Areas around Schmidt Lake, Cunningham Lake, a small pond west of Bruce Road 20 and north of Concession Road 2, and other parts of the GSWC appear to provide important habitats for local amphibian populations. Amphibians were also observed throughout the AOI but not in great numbers. Nonetheless, many TEM plots within the AOI were marked as candidate SWH for all three amphibian-related SWH types, and tadpoles and juveniles were also observed at a few locations. However, as field data collection occurred in the summer and fall of 2022 and focused primarily on other surveys, it was difficult to interpret incidental observations and to distinguish potential amphibian breeding habitats, summer habitats, movement corridors, and possible overwintering habitats. Dedicated amphibian surveys are planned as part of Tier 2 BIS baseline studies.

5.2.1 Candidate SWH within the AOI

Based on the BIS baseline studies completed to date, candidate SWH within the AOI may differ from the BV-specific LSAs and/or RSAs in several respects:

1. Desk-based ecosite screening identified Woodland Raptor Nesting Habitat only outside the AOI due to habitat patches within the AOI not meeting the minimum interior forest area requirement specified in the 6E ECS. However, many plots within the AOI were identified as candidate SWH by field crews during TEM studies (**Figure D-18**), which may be due to a different perception of contiguous habitat or forest size on the ground, along with observations of relevant woodland raptor species in or around these survey plots during the breeding season.

2. Desk-based ecosite screening identified Turtle Nesting Areas only outside the AOI. Turtles require sand or gravel areas for nesting; these habitats were not identified within the AOI and were also rarely found outside the AOI through remotely sensed ecosite classification (**Figure D-19**). However, field crews identified seven shoreline locations within the AOI with evidence of inactive turtle nests and/or potentially suitable habitat for turtle nesting (i.e., “unknown” candidate SWH plots) – these areas should be further investigated for SWH.

3. Additional habitat criteria to identify candidate SWH were met in the AOI (i.e., “yes” plots), but not in the LSA_{TER} or RSA_{AVI}/$RSA_{AVI-AQU}$, for Colonially-Nesting Bird Breeding Habitat (Ground) (**Figure D-11**). Field crews identified four open fields or meadow marshes with scattered shrubs, in close

proximity to watercourses, that could potentially support Brewer's blackbirds. This species was not observed in mid-late August when the TEM field surveys were completed for these plots. However, Brewer's blackbirds typically breed between mid-May to mid-July in southern Ontario (OBBA and Birds Canada 2023); thus, targeted surveys during this period should be completed as part of Tier 2 BIS baseline studies.

4. Additional habitat criteria to identify candidate SWH were met in the AOI and LSA_{TER} (i.e., "yes" and "nearby" plots), but not in the RSA_{AVI}, for Open Country Bird Breeding Habitat (**Figure D-25**). Desk-based ecosite screening did not identify candidate SWH for this habitat type in any applicable BIS study area (**Table 4-1**); however, as discussed in Section 3.1, agricultural fields were not included when developing the ecosite classification dataset. Both Open Country Bird Breeding Habitat and Shrub/Early Successional Bird Breeding Habitat (for which there were also no ecosite matches) may consist of modified habitats that are not Class 1 or 2 agricultural lands and are not being actively used for farming (OMNRF 2015). Additional ground-truthing and engagement with landowners are needed to identify abandoned fields and pasturelands, within and outside the AOI, that may offer suitable nesting habitat for the relevant bird species, including SAR.

5. Additional habitat criteria to identify candidate SWH may have been met in the AOI (i.e., "unknown" plots), but not in the LSA_{TER} or RSA_{AVI}, for Colonially-Nesting Bird Breeding Habitat (Bank and Cliff) (**Figure D-9**). Specifically, TEM field crews found eroding banks at two locations along the Teeswater River within the AOI that could be suitable for bank swallows. Targeted surveys during this species' breeding season from mid-May to mid-July (OBBA and Birds Canada 2023) should be completed in the future.

6. Within the BIS study areas for terrestrial crayfish, incidental observations only occurred within the AOI (and not the LSA_{TER}) during 2022 field studies. However, these findings are likely confounded by accessibility issues in the LSA_{TER} (see Figure B-1 in Appendix B, Chapter 1 for terrestrial survey locations and Figures A-1, A-2, and A-3 in Appendix D, Chapter 1 for aquatic survey locations). Furthermore, terrestrial crayfish chimneys/burrows and a few individuals were recorded throughout the LSA_{AQU} (outside the AOI and LSA_{TER}) by field crews. Thus, the SON-South Bruce siting area, in general, appears to provide important habitat for terrestrial crayfish.

7. Within the past 30 years, two shorebird species – pectoral sandpiper and stilt sandpiper – have only been detected within the AOI and not the LSA_{TER} or $RSA_{AVI\text{-}AQU}$ (**Figure D-3**). The GBIF records for these and other shorebirds, at a marsh ecosite amongst agricultural lands, are potentially relevant to Shorebird Migratory Stopover Area SWH (Section 4.1.3). However, given the rarity of these species' observations (May 23, 2018, and May 3, 2020), it is unlikely that the marsh constitutes significant habitat for pectoral sandpiper, stilt sandpiper, or local shorebird populations.

5.3 Limitations and Next Steps

Existing species observations may supplement ecosite and habitat data to provide further evidence of the presence of candidate SWH. However, the existing spatial datasets include data from other studies/programs with different objectives, incidental observations with inherent reporting biases, limited information on sites within the BIS study areas, and species observations with little to no context. For example, GBIF records may include the species name, location, date, and count, but there is no

information about habitat, activity/behaviour, demographics, type of sign, or other comments that would further inform the identification of candidate SWH. In addition, where a species has only been detected using desk-based data, caution should be taken as those data could be as old as 1970, and the conditions supporting the species' presence in the area may have changed.

With respect to field data, field identification of candidate SWH in 2022 was conducted opportunistically in conjunction with TEM verification (see Appendix B, Chapter 1). TEM surveys were completed in the summer and some SWH types can only be identified and evaluated during spring, fall, and/or winter. A brief summary of the surveys, including seasonal considerations, required to confirm each SWH type was presented in **Table 4-1**. Systematic, detailed, seasonally-appropriate, BV-specific field investigations to confirm SWH, following guidance from the 6E ECS and *Significant Wildlife Habitat Technical Guide*, are planned as part of Tier 2 BIS baseline studies. These Tier 2 studies would only be conducted if the SON-South Bruce siting area is selected for the Project. The NWMO currently anticipates that Project site selection will occur at the end of 2024.

Should the SON-South Bruce siting area be selected for the Project, future Tier 2 SWH studies will prioritize surveying areas with pertinent species observations and/or habitat information from both desk- and field-based data (e.g., plots/polygons identified as candidate SWH, species-rich 'hotspots'), with a focus on areas within the extent of indirect project impacts (i.e., AOI and LSA_{TER}).[22] Survey site selection will also prioritize areas that were inaccessible or not selected for survey in 2022 due to minimum size and/or shape requirements for the TEM program. Future Tier 2 SWH studies will not be restricted to TEM plots or natural/naturalized habitats, as agricultural lands may be considered suitable upland habitats for some SWH types (e.g., Open Country and Shrub/Early Successional Bird Breeding Habitats, Waterfowl Stopover and Staging Areas (Aquatic), Raptor Wintering Area). However, access limitations will continue to be a factor in determining which areas can be surveyed. The NWMO continues to engage with local landowners to gain permission to access their properties. Zoetica is providing input to the NWMO regarding priority locations within which they should seek access based on the baseline information collected to date. Zoetica and the NWMO will continue to discuss opportunities to maximize survey efficiency and coverage, such as the feasibility of conducting certain surveys from a distance (e.g., from public roads).

[22] As described in Zoetica's BPPA Report (Zoetica 2021a), the NWMO defined the AOI as the area within which the Project footprint will be located, and Zoetica designed the LSA_{TER} as a 1 km buffer around the AOI to capture potential indirect impacts of the Project on the terrestrial environment. The focal areas for Tier 2 studies, including confirmation of SWH, may change depending on the Project Description (which is not yet available) and further information about potential project effects.

APPENDIX B – SPECIES LIST

Table B-1. Common and scientific names for species mentioned in this report. Species names follow the NHIC's Ontario species lists, current to March 1, 2023.

Biodiversity Value	Common Name	Scientific Name
VEGETATION		
Vegetation	Alfalfa	*Medicago sativa*
Vegetation	Beaked Spikerush	*Eleocharis rostellata*
Vegetation	Black Ash	*Fraxinus nigra*
Vegetation	Bur Oak	*Quercus macrocarpa*
Vegetation	Bush's Pocket Moss	*Fissidens bushii*
Vegetation	Common Winterberry	*Ilex verticillata*
Vegetation	Eastern Green-violet	*Hybanthus concolor*
Vegetation	Eastern Rough Sedge	*Carex scabrata*
Vegetation	Eastern Swamp Saxifrage	*Micranthes pensylvanica*
Vegetation	Elm	*Ulmus* spp.
Vegetation	Floating Crystalwort	*Riccia fluitans*
Vegetation	Greater Round-leaved Orchid	*Platanthera macrophylla*
Vegetation	Green Arrow Arum	*Peltandra virginica*
Vegetation	Green Dragon	*Arisaema dracontium*
Vegetation	Hill's Pondweed	*Potamogeton hillii*
Vegetation	Joe Pye Weed	*Eutrochium* spp.
Vegetation	Large-leaved Leafy Moss	*Rhizomnium magnifolium*
Vegetation	Milkweed	*Asclepias* spp.
Vegetation	Red Maple	*Acer rubrum*
Vegetation	Rigid Sedge	*Carex tetanica*
Vegetation	Silver Maple	*Acer saccharinum*
Vegetation	Slender Mountain-mint	*Pycnanthemum tenuifolium*
Vegetation	Soybean	*Glycine max*
Vegetation	Sugar Maple	*Acer saccharum*
Vegetation	Tubercled Orchid	*Platanthera flava*
Vegetation	Watercress	*Nasturtium* or *Rorippa* spp.
MAMMALS		
Ungulates	White-tailed Deer	*Odocoileus virginianus*
Carnivores	American Black Bear	*Ursus americanus*
Small Terrestrial Mammals	Northern Raccoon	*Procyon lotor*
Bats	Big Brown Bat	*Eptesicus fuscus*
Bats	Eastern Small-footed Myotis	*Myotis leibii*
Bats	Little Brown Myotis	*Myotis lucifugus*
Bats	Silver-haired Bat	*Lasionycteris noctivagans*
Bats	Tricolored Bat	*Perimyotis subflavus*
HERPETOFAUNA		
Amphibians	American Bullfrog	*Lithobates catesbeianus*
Amphibians	American Toad	*Anaxyrus americanus*
Amphibians	Eastern Newt	*Notophthalmus viridescens*
Amphibians	Eastern Red-backed Salamander	*Plethodon cinereus*
Amphibians	Four-toed Salamander	*Hemidactylium scutatum*
Amphibians	Gray Treefrog	*Dryophytes versicolor*
Amphibians	Green Frog	*Lithobates clamitans*
Amphibians	Northern Leopard Frog	*Lithobates pipiens*
Amphibians	Pickerel Frog	*Lithobates palustris*
Amphibians	Spring Peeper	*Pseudacris crucifer*
Amphibians	Western Chorus Frog – Great Lakes – St. Lawrence – Canadian Shield population	*Pseudacris maculata pop. 1*
Amphibians	Wood Frog	*Lithobates sylvaticus*

Biodiversity Value	Common Name	Scientific Name
Reptiles	Common Five-lined Skink (Great Lakes/St. Lawrence population)	*Plestiodon fasciatus pop. 2*
Reptiles	Eastern Gartersnake	*Thamnophis sirtalis sirtalis*
Reptiles	Eastern Milksnake	*Lampropeltis triangulum*
Reptiles	Eastern Ribbonsnake	*Thamnophis saurita*
Reptiles	Midland Painted Turtle	*Chrysemys picta marginata*
Reptiles	Snapping Turtle	*Chelydra serpentina*
TERRESTRIAL & SEMI-AQUATIC INVERTEBRATES		
Terrestrial Invertebrates	Monarch	*Danaus plexippus*
Terrestrial Invertebrates	Terrestrial Crayfish	Digger Crayfish, *Creaserinus fodiens*
		Great Plains Mudbug, *Lacunicambarus nebrascensis*
Primary and Secondary Producers	River Bluet	*Enallagma anna*
BIRDS		
Upland Breeding Birds	Bank Swallow	*Riparia riparia*
Upland Breeding Birds	Barn Swallow	*Hirundo rustica*
Upland Breeding Birds	Black-billed Cuckoo	*Coccyzus erythropthalmus*
Upland Breeding Birds	Blackburnian Warbler	*Setophaga fusca*
Upland Breeding Birds	Black-throated Blue Warbler	*Setophaga caerulescens*
Upland Breeding Birds	Blue-headed Vireo	*Vireo solitarius*
Upland Breeding Birds	Blue-winged Warbler	*Vermivora cyanoptera*
Upland Breeding Birds	Bobolink	*Dolichonyx oryzivorus*
Upland Breeding Birds	Brewer's Blackbird	*Euphagus cyanocephalus*
Upland Breeding Birds	Brown Creeper	*Certhia americana*
Upland Breeding Birds	Brown Thrasher	*Toxostoma rufum*
Upland Breeding Birds	Canada Warbler	*Cardellina canadensis*
Upland Breeding Birds	Clay-colored Sparrow	*Spizella pallida*
Upland Breeding Birds	Cliff Swallow	*Petrochelidon pyrrhonota*
Upland Breeding Birds	Common Nighthawk	*Chordeiles minor*
Upland Breeding Birds	Eastern Meadowlark	*Sturnella magna*
Upland Breeding Birds	Eastern Towhee	*Pipilo erythrophthalmus*
Upland Breeding Birds	Eastern Whip-poor-will	*Antrostomus vociferus*
Upland Breeding Birds	Eastern Wood-pewee	*Contopus virens*
Upland Breeding Birds	Evening Grosbeak	*Coccothraustes vespertinus*
Upland Breeding Birds	Field Sparrow	*Spizella pusilla*
Upland Breeding Birds	Fox Sparrow	*Passerella iliaca*
Upland Breeding Birds	Grasshopper Sparrow	*Ammodramus savannarum*
Upland Breeding Birds	Gray Catbird	*Dumetella carolinensis*
Upland Breeding Birds	Horned Lark	*Eremophila alpestris*
Upland Breeding Birds	House Wren	*Troglodytes aedon*
Upland Breeding Birds	Northern Cardinal	*Cardinalis cardinalis*
Upland Breeding Birds	Northern Parula	*Setophaga americana*
Upland Breeding Birds	Northern Rough-winged Swallow	*Stelgidopteryx serripennis*
Upland Breeding Birds	Ovenbird	*Seiurus aurocapilla*
Upland Breeding Birds	Palm Warbler	*Setophaga palmarum*
Upland Breeding Birds	Pileated Woodpecker	*Dryocopus pileatus*
Upland Breeding Birds	Red-breasted Nuthatch	*Sitta canadensis*
Upland Breeding Birds	Ruffed Grouse	*Bonasa umbellus*
Upland Breeding Birds	Rusty Blackbird	*Euphagus carolinus*
Upland Breeding Birds	Savannah Sparrow	*Passerculus sandwichensis*
Upland Breeding Birds	Sedge Wren	*Cistothorus stellaris*
Upland Breeding Birds	Sharp-tailed Grouse	*Tympanuchus phasianellus*
Upland Breeding Birds	Veery	*Catharus fuscescens*
Upland Breeding Birds	Vesper Sparrow	*Pooecetes gramineus*
Upland Breeding Birds	White-crowned Sparrow	*Zonotrichia leucophrys*

Biodiversity Value	Common Name	Scientific Name
Upland Breeding Birds	Wild Turkey	*Meleagris gallopavo*
Upland Breeding Birds	Willow Flycatcher	*Empidonax traillii*
Upland Breeding Birds	Winter Wren	*Troglodytes hiemalis*
Upland Breeding Birds	Wood Thrush	*Hylocichla mustelina*
Upland Breeding Birds	Yellow-bellied Sapsucker	*Sphyrapicus varius*
Upland Breeding Birds	Yellow-billed Cuckoo	*Coccyzus americanus*
Shorebirds	Dunlin	*Calidris alpina*
Shorebirds	Greater Yellowlegs	*Tringa melanoleuca*
Shorebirds	Least Sandpiper	*Calidris minutilla*
Shorebirds	Lesser Yellowlegs	*Tringa flavipes*
Shorebirds	Pectoral Sandpiper	*Calidris melanotos*
Shorebirds	Semipalmated Plover	*Charadrius semipalmatus*
Shorebirds	Semipalmated Sandpiper	*Calidris pusilla*
Shorebirds	Solitary Sandpiper	*Tringa solitaria*
Shorebirds	Spotted Sandpiper	*Actitis macularius*
Shorebirds	Stilt Sandpiper	*Calidris himantopus*
Shorebirds	Upland Sandpiper	*Bartramia longicauda*
Waterbirds	American Black Duck	*Anas rubripes*
Waterbirds	American Wigeon	*Mareca americana*
Waterbirds	Black Tern	*Chlidonias niger*
Waterbirds	Blue-winged Teal	*Spatula discors*
Waterbirds	Bufflehead	*Bucephala albeola*
Waterbirds	Cackling Goose	*Branta hutchinsii*
Waterbirds	Canada Goose	*Branta canadensis*
Waterbirds	Canvasback	*Aythya valisineria*
Waterbirds	Caspian Tern	*Hydroprogne caspia*
Waterbirds	Common Goldeneye	*Bucephala clangula*
Waterbirds	Common Loon	*Gavia immer*
Waterbirds	Common Merganser	*Mergus merganser*
Waterbirds	Gadwall	*Mareca strepera*
Waterbirds	Great Black-backed Gull	*Larus marinus*
Waterbirds	Great Blue Heron	*Ardea herodias*
Waterbirds	Great Egret	*Ardea alba*
Waterbirds	Greater White-fronted Goose	*B-3nswer albifrons*
Waterbirds	Green Heron	*Butorides virescens*
Waterbirds	Green-winged Teal	*Anas crecca*
Waterbirds	Herring Gull	*Larus argentatus*
Waterbirds	Hooded Merganser	*Lophodytes cucullatus*
Waterbirds	Horned Grebe	*Podiceps auritus*
Waterbirds	Lesser Scaup	*Aythya affinis*
Waterbirds	Long-tailed Duck	*Clangula hyemalis*
Waterbirds	Mallard	*Anas platyrhynchos*
Waterbirds	Northern Pintail	*Anas acuta*
Waterbirds	Northern Shoveler	*Spatula clypeata*
Waterbirds	Pied-billed Grebe	*Podilymbus podiceps*
Waterbirds	Red-breasted Merganser	*Mergus serrator*
Waterbirds	Red-necked Grebe	*Podiceps grisegena*
Waterbirds	Ring-billed Gull	*Larus delawarensis*
Waterbirds	Ring-necked Duck	*Aythya collaris*
Waterbirds	Sandhill Crane	*Antigone canadensis*
Waterbirds	Snow Goose	*Anser caerulescens*
Waterbirds	Sora	*Porzana carolina*
Waterbirds	Tundra Swan	*Cygnus columbianus*
Waterbirds	Virginia Rail	*Rallus limicola*
Waterbirds	White-winged Scoter	*Melanitta deglandi*

Biodiversity Value	Common Name	Scientific Name
Waterbirds	Wood Duck	*Aix sponsa*
Raptors	American Kestrel	*Falco sparverius*
Raptors	Bald Eagle	*Haliaeetus leucocephalus*
Raptors	Broad-winged Hawk	*Buteo platypterus*
Raptors	Cooper's Hawk	*Accipiter cooperii*
Raptors	Eastern Screech-Owl	*Megascops asio*
Raptors	Great Horned Owl	*Bubo virginianus*
Raptors	Merlin	*Falco columbarius*
Raptors	Northern Harrier	*Circus hudsonius*
Raptors	Osprey	*Pandion haliaetus*
Raptors	Red-tailed Hawk	*Buteo jamaicensis*
Raptors	Rough-legged Hawk	*Buteo lagopus*
Raptors	Snowy Owl	*Bubo scandiacus*

APPENDIX C – SUPPORTING INFORMATION FOR SWH ANALYSES AND MAPPING

Table C-1. Existing spatial datasets and reports investigated and analyzed for the 2023 SWH baseline report. Relevant habitat features and species observations are included on the candidate SWH maps presented in Appendix D of this report, except for data already published in other NWMO-related reports. Updated datasets will be periodically requested/acquired as the BIS baseline program progresses.

Data Source / Owner	Dataset	Data Format	Date Accessed / Received	Contains relevant[1] data?
Zoetica / Sumac Geomatics *BIS Tier 1 studies*	Ecosite Classification Dataset	Shapefile	03/2022	Y
Toronto Zoo's Native Bat Conservation Program (NBCP) *Partnership with NWMO*	2020 Bat Activities Report (Thorne et al. 2021)	Unpublished Report	06/2021	Y
	2021 Bat Activities Report (Sparrow-Scinocca et al. 2022)	Unpublished Report	09/2022	Y
	2022 Bat Activities Report (Thorne 2023)	Unpublished Report	10/2023	Y
Tulloch Environmental *Preliminary environmental studies for the Project*	July 2020 Site Reconnaissance (Tulloch Environmental 2020)	Unpublished Report	10/2020	Y
	October 2020 Natural Heritage Features (Tulloch Environmental 2021)	Unpublished Report	04/2021	Y
Ontario Natural Heritage Information Centre (NHIC)	Plant Community Occurrence	Shapefile	12/2020	N
	Plant Community Observation	Shapefile	12/2020	N

	Wildlife Activity Area	Shapefile	12/2020	Y
	Southern Ontario Land Resource Information System (SOLRIS) 3.0	TIFF (Raster)	08/2022	N
	Abandoned Mines Information System (AMIS)	Geodatabase	03/2020	N
	Karst	PDF Map	08/2022	N
	Surficial Geology	Shapefile	08/2022	N
	Physiography	Shapefile	08/2022	N
Global Biodiversity Information Facility (GBIF)	Species Occurrences	CSV	10/2021	Y

Notes:

1. Zoetica determined dataset relevance based on geographic and temporal relevance, as well as relevance to SWH. For example, data that were not within the relevant BIS study areas, data that were too old to be considered relevant, or data that did not include records of species of relevance to SWH were labelled "N" for not containing relevant data.

Table C-2. Conversion of Great Lakes Shoreline Ecosystem (GLSE) ecosite codes (Lee et al. 2021a) to the Ecological Land Classification (ELC) for Southern Ontario: First Approximation, 1998 codes (Lee et al. 1998) for SWH analyses. Data are currently limited to the local study area for ecosystem function and services (LSA_{ECO}). Rows highlighted in grey indicate ELC-1998 codes manually assigned by Zoetica based on ecosite and vegetation descriptions. All other rows are derived from the ecosite tables provided in (Lee et al. 2021b).

Table C-3. Seasonal timing window(s) for mapping existing species observations (e.g., NHIC, GBIF datasets) and 2022 incidental field observations for each SWH type in Ecoregion 6E (OMNRF 2015).[1,2,3]

SWH Type	Timing Window for Mapping	Notes and References[4]
Cliffs and Talus Slopes	All year	-
Sand Barren	All year	-
Alvar	All year	-
Old Growth Forest	Apr 1 – Aug 31 (indicator birds)	ECCC Nesting Zone C2 (ECCC 2018)
Savannah	All year	-
Tallgrass Prairie	All year	-
Other Rare Vegetation Communities	All year	-
Waterfowl Stopover and Staging Areas (Terrestrial)	Mar 1 – May 15	OBBA-3 Safe Dates (BSC et al. 2021); 6E ECS (OMNRF 2015)
Waterfowl Stopover and Staging Areas (Aquatic)	Mar 1 – May 15 Jul 15 – Oct 31	6E ECS (OMNRF 2015); Ontario bird monitoring guidelines (OMNR 2011b); OBBA-3 Safe Dates (BSC et al. 2021)
Shorebird Migratory Stopover Area	May 1 – Jun 15 Jul 1 - Oct 31	6E ECS (OMNRF 2015)
Raptor Wintering Area	Dec 1 – Feb 29	Migration information from Ontario Field Ornithologists (Pittaway 1999) and field naturalists (Burrell 2012)
Bat Hibernacula	Aug 1 – Apr 30	6E ECS (OMNRF 2015); Ontario bat habitat management guidelines (Gerson 1984) – *includes peak swarming (August) as these locations are near hibernacula*
Bat Maternity Colonies	Apr 1 – Jul 31	Life cycle timing of Ontario and eastern North American bats (MNR 2013, Silvis et al. 2016)
Turtle Wintering Areas	Sep 1 – Apr 30	6E ECS (OMNRF 2015) – *includes fall and spring basking (September and April) as these locations are near hibernacula*
Reptile Hibernaculum	Sep 1 – Apr 30	6E ECS (OMNRF 2015) – *includes fall and spring basking (September and April) as these locations are near hibernacula*
Colonially-Nesting Bird Breeding Habitat (Bank and Cliff)	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs)	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Colonially -Nesting Bird Breeding Habitat (Ground)	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Deer Yarding Areas	Jan 15 – Feb 28	Ontario deer habitat management guidelines (Voigt et al. 1997)
Deer Winter Congregation Areas	Dec 1 – Mar 31	Ontario deer habitat management guidelines (Voigt et al. 1997)
Waterfowl Nesting Area	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Bald Eagle and Osprey Nesting, Foraging and Perching Habitat	Mar 15 – Aug 31	6E ECS (OMNRF 2015); ECCC Nesting Zone C2 (ECCC 2018)
Woodland Raptor Nesting Habitat	Mar 15 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018); 6E ECS (OMNRF 2015)
Turtle Nesting Areas	May 1 – Jul 15 Sep 1 – Sep 30 (hatchlings)	Ontario BMPs for at-risk reptiles and amphibians (OMNRF 2016); Ontario Reptile and Amphibian Field Guide (Ontario Nature 2022)
Seeps and Springs	All year	-
Amphibian Breeding Habitat (Woodland)	Mar 1 – Jun 30 Jul 1 – Jul 31 (tadpoles)	6E ECS (OMNRF 2015); Ontario BMPs for at-risk reptiles and amphibians (OMNRF 2016); Ontario Reptile and Amphibian Field Guide (Ontario Nature 2022); annual chronology information (City of Toronto 2015)

SWH Type	Timing Window for Mapping	Notes and References[4]
Amphibian Breeding Habitat (Wetlands)	Mar 1 – Jun 30 Jul 1 – Jul 31 (tadpoles)	6E ECS (OMNRF 2015); Ontario BMPs for at-risk reptiles and amphibians (OMNRF 2016); Ontario Reptile and Amphibian Field Guide (Ontario Nature 2022); annual chronology information (City of Toronto 2015)
Woodland Area-Sensitive Bird Breeding Habitat	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Marsh Breeding Bird Habitat	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Open Country Bird Breeding Habitat	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Shrub/Early Successional Bird Breeding Habitat	Apr 1 – Aug 31	ECCC Nesting Zone C2 (ECCC 2018)
Terrestrial Crayfish	Apr 1 – Aug 31	6E ECS (OMNRF 2015)
Special Concern and Rare Wildlife Species	All year	-
Amphibian Movement Corridors[5]	Jul 1 – Apr 30	MMP Participant's Handbook for Surveying Amphibians (BSC 2009)
Deer Movement Corridors	Nov 1 – Dec 31 Mar 15 – Apr 30	6E ECS (OMNRF 2015); Ontario deer habitat management guidelines (Voigt et al. 1997)

Notes:

1. Seasonal windows are generalized for the BV and phenological differences between species within the group may not be captured. To be conservative, there are some overlapping 'shoulder' periods between breeding, spring and fall migration, and winter seasons.
2. Due to the limited information available from existing desk-based records, it may not be possible to distinguish local breeding populations from late spring and early fall migrants. Similarly, it may not be possible to distinguish late fall migrants and early spring migrants from local overwintering populations. Nevertheless, existing species observations from the NHIC and GBIF are presented in Section 4.0 and Appendix D to give a general idea of seasonal wildlife presence and distribution within the BIS study areas.
3. Timing windows for mapping were also applied to 2022 field observations that lacked additional context of potential relevance to SWH. See Section 3.2 for more information.
4. Abbreviations: OBBA-3 = Ontario Breeding Bird Atlas-3; 6E ECS = Significant Wildlife Habitat Criteria Schedules for Ecoregion 6E; ECCC = Environment and Climate Change Canada; BMPs = Best Management Practices
5. A broad timing window of July 1 to April 30 (i.e., a conservative inverse of amphibian breeding season) was applied for mapping species observations for Amphibian Movement Corridors. However, this window may capture observations of overwintering amphibians, which would not be relevant to the SWH type. Relevant desk- and field-based observations to date have not extended past October 16.

APPENDIX D – CANDIDATE SWH MAPS AND SUPPLEMENTAL DATA TABLES

The following maps present candidate SWH as identified through ecosite analysis, habitat criteria, and relevant species observations according to the SWH Criteria Schedules for Ecoregion 6E (OMNRF 2015). Supplemental tables for field- and desk-based species observations, where available, are provided after each map. Explanatory notes and common abbreviations for the supplemental tables are provided below:

- The first column of each table denotes the NHIC 1 km grid square ID. Refer to the corresponding figure for the labelled grid locations where observations occur. The grid system and numbering are standardized across maps.
- Study areas (AOI and BV-specific LSAs and RSAs): 1 = detected, 0 = not detected. For the purposes of these tables, the indicated study area includes overlap with other study area(s) that may be encompassed within its boundaries. More than one RSA may be shown in each table if the SWH type is relevant to multiple BVs or due to variation in the species' ecology; "/" indicates that the RSA is not applicable to the species.
- Coordinates are not provided for species of conservation concern (SAR and provincially rare species) due to the sensitive nature of these data, as per the NHIC's Sensitive Data Location Standards (NHIC n.d.). For species of conservation concern, the indicated study area(s) is based on overlap with the 1 km grid square, not the actual point or polygon location.
- Count: "U" = unspecified for desk-based data. For the 2022 field data, Zoetica assumed a count of one individual unless otherwise indicated, a count of one individual when a singular observation (e.g., "frog") was recorded in the field notes, and more than one individual if plural observations (e.g., "frogs") were recorded. Zoetica simplified qualitative information into "many", "multiple", and "several". The "many" category includes field incidental observation entries of "many", "large amount", "large number", "lots", and "numerous" individuals, whereas "multiple" and "several" included only entries with "multiple" and "several" individuals, respectively.
- Observation Type (2022 field data): ad = adult, juv = juvenile, pb = presumed breeding. Zoetica assumed 'unspecified' observation type and adult organisms unless otherwise indicated. However, "ad" was included when more than one age class of a species was detected within a single observation.
- Source Type (2022 field data): "TEM SWH" refers to field observations made during the Tier 1 candidate SWH identification surveys completed alongside TEM. "Potential SWH Incidental" refers to field observations recorded on the BIS *Incidental Wildlife and Plant Observations* data form (Zoetica 2022) that were marked by surveyors as a potential indicator of SWH. "Other Incidental" refers to field observations made during other Tier 1 baseline programs (TEM, AHM, eDNA).

NWMO Biodiversity Impact Studies

Candidate SWH for Waterfowl Nesting Area - North $RSA_{AVI-AQU}$

Figure D-16a

- Local Study Area (LSA_{ECO})
- Regional Study Area ($RSA_{AVI-AQU}$)
- Watercourse
- Lake
- Wetland Outside LSA_{ECO}
- South Bruce Boundary
- Municipal Boundary
- Highway
- Local Road
- 120m Buffer from Ecosites that Match SWH Criteria
- Ecosites within 120m Buffer
- Ecosites that Do Not Match the SWH Criteria [1800]

Ecosites that Match SWH Criteria

- Hardwood Swamp [183]
- Shrub Swamp [12]
- Marsh [160]

- Observation Location
- 1km x 1km grid square with observations

Species Observed

Desk-based (GBIF) [132]

- American Wigeon [3]
- Blue-winged Teal [3]
- Bufflehead [6]
- Canada Goose [38]
- Common Goldeneye [4]
- Common Merganser [7]
- Gadwall [1]
- Green-winged Teal [5]
- Hooded Merganser [4]
- Mallard [29]
- Northern Pintail [3]
- Northern Shoveler [1]
- Red-breasted Merganser [2]
- Wood Duck [26]

Field Incidental [10]

- Wood Duck [6]
- Mallard [1]
- Unk Duck Species [3]

Observation Type (Fieldwork Only)

- Visual [6]
- Unspecified [2]
- Visual Juvenile [1]
- Nest Box [1]

Candidate SWH in Plot

- Yes [49]
- Unknown [16]
- Nearby [1]
- No [407]

ZOETICA

Data received from:
Ontario GeoHub — Municipal Boundary Lower and Upper Tiers (MMAH); OHN Waterbody (MNRF); OHN Watercourse (MNRF); ORN Road Element (MNRF); UTM 1km Grid (MNRF); Wetlands (MNRF)
NWMO — AOI; NWMO Purchased or Optioned Land
GBIF.org — GBIF Occurence Download Accessed Oct 2021
Noun Project — CC BY 3.0: "Cattails" by Melissa Schmitt; "Eye" by Nicholas Menghini; "Egg" by Vectors Point; "Bird Nest" by MihiMihi; "Bird" by Chocolate Icon; "Snake" by Adrien Coquet
Wetlands and water features are mapped using ecosite data within the LSA_{ECO} and data available from Ontario GeoHub outside the LSA_{ECO}.

Project CRS: NAD83 / UTM zone 17N		
Author: DM	Reviewed by: CC	Approved by: HB
January 23, 2024	Map ID: NWMO_BIS_D178	

NWMO Biodiversity Impact Studies

Candidate SWH for Waterfowl Nesting Area - South $RSA_{AVI-AQU}$

Figure D-16b

- Area of Interest (AOI)
- Local Study Area (LSA_{TER})
- Local Study Area (LSA_{ECO})
- Regional Study Area ($RSA_{AVI-AQU}$)
- Watercourse
- Lake
- Wetland Outside LSA_{ECO}
- South Bruce Boundary
- Municipal Boundary
- Local Road
- 120m Buffer from Ecosites that Match SWH Criteria
- Ecosites within 120m Buffer
- Ecosites that Do Not Match the SWH Criteria [1800]

Ecosites that Match SWH Criteria

- Hardwood Swamp [183]
- Shrub Swamp [12]
- Marsh [160]

- Conifer Swamp [65]
- Mixedwood Swamp [252]
- Hardwood Swamp [506]

Observation Location ☐ 1km x 1km grid square with observations

Species Observed

Desk-Based (GBIF) [6]

- Eastern Newt [1]
- Gray Treefrog [1]
- Four-toed Salamander [1]
- Wood Frog [2]
- Western Chorus Frog [1]

Field Incidental [91]

- American Toad [9]
- Eastern Newt [1]
- Gray Treefrog [5]
- Spring Peeper [20]
- Wood Frog [37]
- Unk. Frog [12]
- Unk. Amphibian [7]

Observation Type (Fieldwork Only)

- Potential breeding habitat [3]
- Visual [18]
- Visual Juvenile [29]
- Visual Tadpole [4]
- Unspecified [14]
- Vocal [23]

Candidate SWH in Plot

Yes [394] Unknown [38] No [41]

*Amphibian Breeding Habitat (Woodland) require the presence of a wetland, pond, or woodland pool >500m². Lakes or ponds that meet this requirement are highlighted on this map, but field studies are required before ecosite polygons can no longer be considered candidates.

Observation Location
1km x 1km grid square with observations

Species Observed

Desk-based (GBIF) [46]

- Black-throated Blue Warbler [1]
- Black-throated Green Warbler [5]
- Blackburnian Warbler [2]
- Blue-headed Vireo [1]
- Canada Warbler [1]
- Northern Parula [2]
- Ovenbird [10]
- Pileated Woodpecker [1]
- Red-breasted Nuthatch [3]
- Scarlet Tanager [4]
- Veery [5]
- Winter Wren [5]
- Yellow-bellied Sapsucker [6]

Field Incidental [9]

- Blue-headed Vireo [2]
- Yellow-bellied Sapsucker [3]
- Red-breasted Nuthatch [3]
- Pileated Woodpecker [1]

Observation Type (Fieldwork Only)

- Unspecified [1]
- Sign (Bird) [2]
- Vocal [6]

Candidate SWH in Plot

- Yes [74]
- Unknown [12]
- Nearby [4]
- No [79]

Ecosites that Match the SWH Criteria

- Meadow [1]

○ Observation Location ☐ 1km x 1km grid square with observations

Species Observed

Desk-based (GBIF) [50]

- American Kestrel [4]
- Bobolink (SAR) [9]
- Eastern Meadowlark (SAR) [9]
- Grasshopper Sparrow [1]
- Horned Lark [1]
- Northern Harrier [3]
- Savannah Sparrow [12]
- Upland Sandpiper [5]
- Vesper Sparrow [6]

Field Incidental [3]

- Bobolink (SAR) [2]
- Eastern Meadowlark (SAR) [1]

Observation Type (Fieldwork Only)

Visual [1] Vocal, Visual [1]

Vocal [1]

NHIC 1km Grid Square

Bobolink (SAR) Eastern Meadowlark (SAR)

SAR = Species at Risk

SAR and Provincially Rare species from NHIC or field incidentals were masked with a 1km grid and may occur anywhere within that grid square. Circle colour(s) within the grid square represent the species observed incidentally. Species may have been observed more than once within a grid square.

NWMO Biodiversity Impact Studies

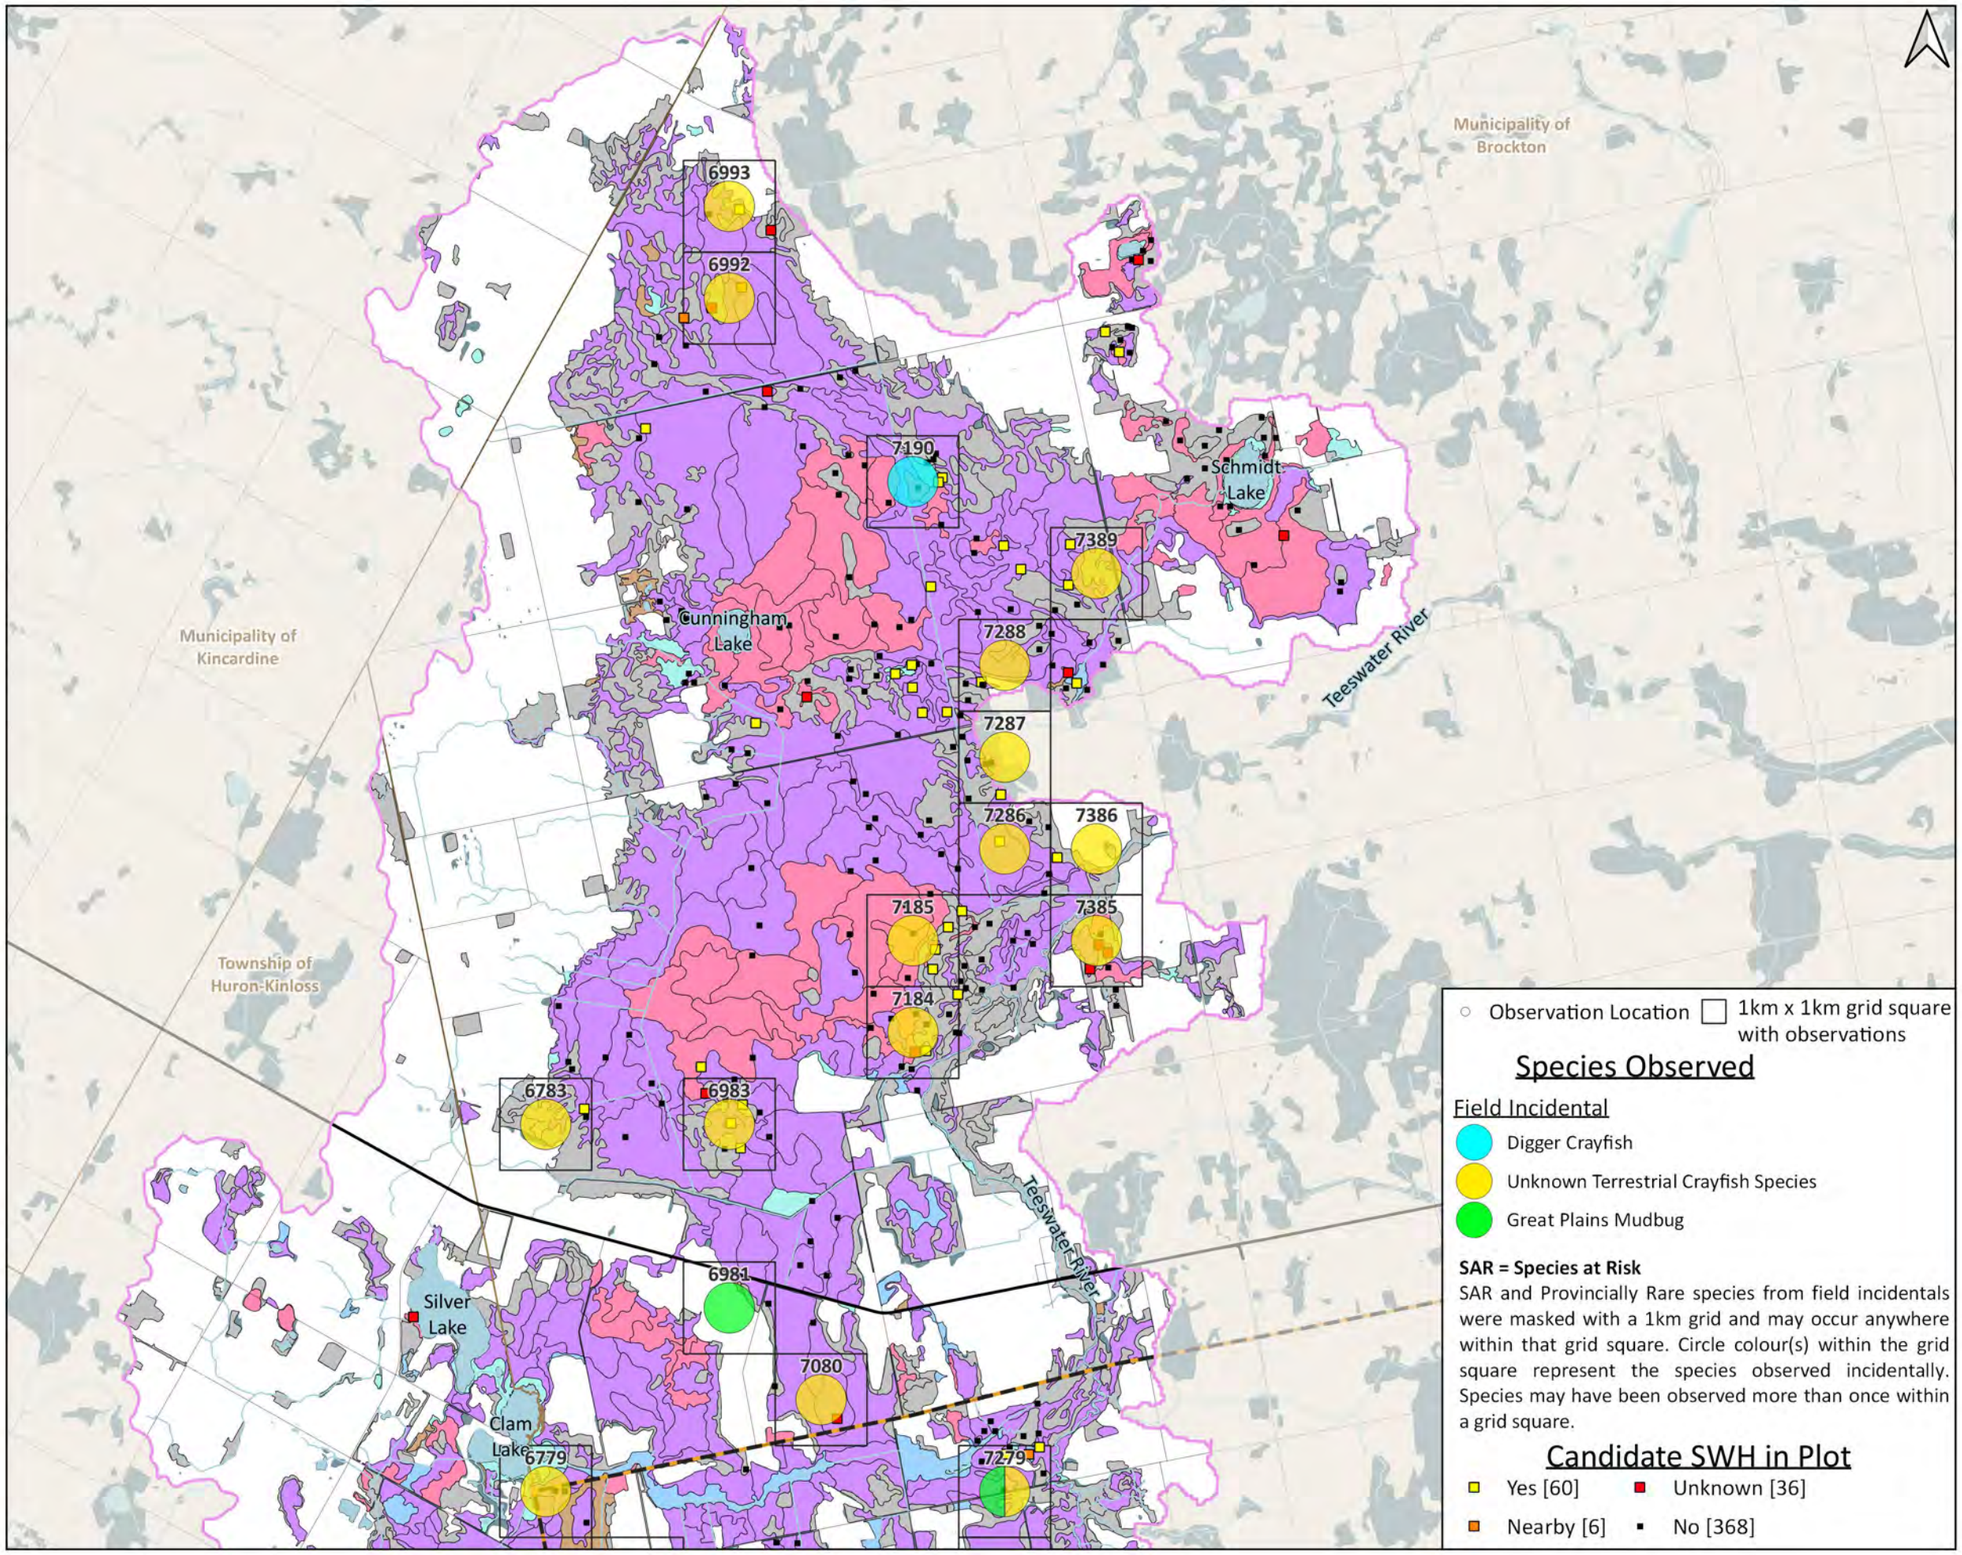
Candidate SWH for Terrestrial Crayfish - North LSA_{AQU}

Figure D-27a



- Local Study Area (LSA_{AQU})
- Watercourse
- Lake
- Wetland Outside LSA_{AQU}
- South Bruce Boundary
- Municipal Boundary
- Highway
- Local Road
- Ecosites that Do Not Match the SWH Criteria [1136]

Ecosites that Match the SWH Criteria

- Mixedwood Swamp [248]
- Hardwood Swamp [501]
- Shrub Swamp [55]
- Marsh [157]
- Meadow [31]

- Observation Location
- 1km x 1km grid square with observations

Species Observed

Field Incidental

- Digger Crayfish
- Unknown Terrestrial Crayfish Species
- Great Plains Mudbug

SAR = Species at Risk

SAR and Provincially Rare species from field incidentals were masked with a 1km grid and may occur anywhere within that grid square. Circle colour(s) within the grid square represent the species observed incidentally. Species may have been observed more than once within a grid square.

Candidate SWH in Plot

- Yes [60]
- Unknown [36]

APPENDIX E – RESULTS OF ECOSITE SCREENING FOR CANDIDATE SWH

Table E-1. Ecosite matches for each SWH within the AOI, LSA_{TER} or LSA_{AQU}, and TEM-completed portions of BV-specific RSAs. GLSE ecosites determined through desk- and field-based TEM were converted to the ELC-1998 codes (see **Table C-2**) and compared with the ecosite criteria listed in the 6E ECS. Additional ecosite screening steps are also noted. Where minimum area sizes are required to fulfill SWH requirements, Zoetica included ecosite polygons even if the larger habitat patch extended outside the applicable study areas. That is, habitat patch size was considered holistically and not artificially cut off at the study area boundary.

SWH type	GLSE ecosite matches
Waterfowl Stopover and Staging Areas (Terrestrial) Figure D-1	MEO-k1, MEO-k2, MEO-k3, MEO-k4, MEO-n2, MEO-n3, MEW-Sk1, MEW-Sk2, MEW-Sk3, MEW-Sk4, MEW-Sn1, MEW-Sn2, MEW-Tk1, MEW-Tk3, MEW-Tk4, SLT-Hn1, SLT-Hn2 (62 polygons)
Waterfowl Stopover and Staging Areas (Aquatic) Figure D-2	MAE-m1, MAE-o1, MAS-o2, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3 (521 polygons)
Shorebird Migratory Stopover Area Figure D-3	MAM-m1, MAM-o1 (145 polygons)
Raptor Wintering Area Figure D-4 – Bald Eagle Figure D-5 – Hawk/Owl	SWT-Cm1, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm15, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNf1, TRT-HNf11, TRT-HNf18, TRT-HNf25, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd2, TRT-MNd3, TRT-MNd5, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf2, TRT-MNf3, TRT-MNf8, TRT-MNf9 (307 polygons – Bald Eagle only; mapped polygons screened for proximity to large rivers and lakes (i.e., within 200 m of Teeswater River; lakes >1 ha). Desk-based ecosite screening for minimum size requirements for hawks and owls (>15 ha upland and >20 ha forest/upland together) did not result in any ecosite matches.
Bat Hibernacula	None
Bat Maternity Colonies Figure D-6	SWT-Hm1, SWT-Hm10, SWT-Hm12, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm4, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd7, TRT-HNd8, TRT-HNf1, TRT-HNf11, TRT-HNf18, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf8, TRT-MNd1, TRT-MNd15, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (740 polygons)
Turtle Wintering Areas Figure D-7	AOO-1, MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, OAL-m1, OAL-o1, OAR-m1, SSL-m1, SSL-o1, SST-m1, SST-o1, SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6 (1,068 polygons)
Reptile Hibernaculum Figure D-8	TRT-CNd1, TRT-CNd3, TRT-CNd6, TRT-CNd7, TRT-CNf1, TRT-HNd1, TRT-HNd10, TRT-HNd11, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNd9, TRT-HNf1, TRT-HNf11, TRT-HNf15, TRT-HNf17, TRT-HNf18, TRT-HNf25, TRT-HNf26, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd16, TRT-MNd17, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf13, TRT-MNf2, TRT-MNf3, TRT-MNf4 (784 polygons)
Colonially-Nesting Bird Breeding Habitat (Bank and Cliff) Figure D-9	MEO-k1, MEO-k3, MEO-n2, MEW-Sk1, MEW-Sk3, MEW-Sn1, MEW-Sn2, MEW-Tk1, MEW-Tk3, SLT-Hn1 (29 polygons)

SWH type	GLSE ecosite matches
Colonially-Nesting Bird Breeding Habitat (Tree/Shrubs) Figure D-10	FEW-T1, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm6, SWT-Mo2, SWT-Mo3, SWT-Mo6 (657 polygons)
Colonially-Nesting Bird Breeding Habitat (Ground) Figure D-11 – Brewer's Blackbird	MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, MEO-k1, MEO-k3, MEO-n2, MEW-Sk1, MEW-Sk3, MEW-Sn1, MEW-Sn2, MEW-Tk1, MEW-Tk3, SLT-Hn1 (124 polygons – Brewer's Blackbird only
Deer Yarding Areas Figure D-12	AGW-2, AGW-3, SLT-Hn1, SLT-Hn2, SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Mm1, SWT-Mm4, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-CZ1, TRT-CZ12, TRT-CZ2, TRT-CZ3, TRT-MNd1, TRT-MNd15, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9, TRT-MZ21, TRT-MZ6, TRT-MZ7 (577 polygons)
Deer Winter Congregation Areas Figure D-13	SWT-Cm1, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm12, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd7, TRT-HNd8, TRT-HNf1, TRT-HNf18, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-MNd1, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf11, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf9 (423 polygons, screened for suitable/typical size requirements of >100 ha)
Cliffs and Talus Slopes	None
Sand Barren	None
Alvar Figure D-14	TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd7, TRT-CNd8 (58 polygons, screened for minimum size requirement of >0.5 ha)
Old Growth Forest Figure D-15	SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-HNd1, TRT-HNd10, TRT-HNd11, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNd9, TRT-HNf1, TRT-HNf11, TRT-HNf15, TRT-HNf17, TRT-HNf18, TRT-HNf25, TRT-HNf26, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd16, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf13, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (1,135 polygons, screened for minimum size requirements of ≥30 ha overall or ≥10 ha interior habitat)
Savannah	None
Tallgrass Prairie	None
Other Rare Vegetation Communities	To be determined through discussions with MNRF and NHIC
Waterfowl Nesting Area Figure D-16	MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, SSL-m1, SST-m1, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8 (355 polygons, including upland habitats within 120 m of ecosite matches)

SWH type	GLSE ecosite matches
Bald Eagle and Osprey Nesting, Foraging, and Perching Habitat Figure D-17	SWT-Cm1, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm15, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNf1, TRT-HNf11, TRT-HNf18, TRT-HNf25, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd2, TRT-MNd3, TRT-MNd5, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf2, TRT-MNf3, TRT-MNf8, TRT-MNf9 (307 polygons, screened for proximity to large rivers and lakes; i.e., within 200 m of Teeswater River, lakes >1 ha)
Woodland Raptor Nesting Habitat Figure D-18	SWT-Co1, SWT-Co5, SWT-Hm1, SWT-Hm5, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CZ1, TRT-HNd1, TRT-HNd3, TRT-HNf1, TRT-MNd1, TRT-MNd6, TRT-MNf1, TRT-MNf3, TRT-MNf7 (54 polygons, screened for minimum size requirements of >30 ha overall with >10 ha interior habitat)
Turtle Nesting Areas Figure D-19	MAE-m1, MAE-o1, MAS-o2 (15 polygons)
Seeps and Springs Figure D-20	TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd7, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-HNd1, TRT-HNd10, TRT-HNd11, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNd9, TRT-HNf1, TRT-HNf11, TRT-HNf15, TRT-HNf17, TRT-HNf18, TRT-HNf25, TRT-HNf26, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd16, TRT-MNd17, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf13, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (841 polygons)
Amphibian Breeding Habitat (Woodland) Figure D-21	SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd7, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-HNd1, TRT-HNd10, TRT-HNd11, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNd9, TRT-HNf1, TRT-HNf11, TRT-HNf15, TRT-HNf17, TRT-HNf18, TRT-HNf25, TRT-HNf26, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd16, TRT-MNd17, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf13, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (1,664 polygons, not screened for presence of wetland, pond, or woodland pool >500 m^2)
Amphibian Breeding Habitat (Wetlands) Figure D-22	AOO-1, FEW-T1, MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, OAL-m1, OAL-o1, OAR-m1, SSL-m1, SSL-o1, SST-m1, SST-o1, SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6 (1,070 polygons, screened for suitable size >500 m^2)
Woodland Area-Sensitive Bird Breeding Habitat Figure D-23	SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm12, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm4, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd8, TRT-HNf1, TRT-HNf11, TRT-HNf18, TRT-HNf40, TRT-HNf5, TRT-MNd1, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8 (445 polygons, screened for minimum size requirements of >30 ha overall)

SWH type	GLSE ecosite matches
Marsh Bird Breeding Habitat Figure D-24	MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, MEO-k1, MEO-k2, MEO-k3, MEO-k4, MEO-n2, MEO-n3, MEW-Sk1, MEW-Sk2, MEW-Sk3, MEW-Sk4, MEW-Sn1, MEW-Sn2, MEW-Tk1, MEW-Tk3, MEW-Tk4, SSL-m1, SSL-o1, SST-m1, SST-o1, SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6 (1,097 polygons)
Open Country Bird Breeding Habitat Figure D-25	None after screening for minimum size requirement of >30 ha
Shrub/Early Successional Bird Breeding Habitat Figure D-26	SLT-Hn1 (1 polygon, screened for minimum size requirement of >10 ha)
Terrestrial Crayfish Figure D-27	MAE-m1, MAE-o1, MAM-m1, MAM-o1, MAS-o2, MEO-k1, MEO-k2, MEO-k3, MEO-k4, MEO-n2, MEO-n3, MEW-Sk1, MEW-Sk3, MEW-Sk4, MEW-Sn1, MEW-Sn2, MEW-Tk1, MEW-Tk3, MEW-Tk4, SSL-m1, SSL-o1, SST-m1, SST-o1, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6 (992 polygons)
Special Concern and Rare Wildlife Species	N/A
Amphibian Movement Corridors Figure D-28	SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm11, SWT-Hm12, SWT-Hm13, SWT-Hm15, SWT-Hm2, SWT-Hm3, SWT-Hm5, SWT-Hm6, SWT-Hm7, SWT-Hm8, SWT-Hm9, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm2, SWT-Mm3, SWT-Mm4, SWT-Mm5, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd7, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-HNd1, TRT-HNd10, TRT-HNd11, TRT-HNd3, TRT-HNd4, TRT-HNd7, TRT-HNd8, TRT-HNd9, TRT-HNf1, TRT-HNf11, TRT-HNf15, TRT-HNf17, TRT-HNf18, TRT-HNf25, TRT-HNf26, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf7, TRT-HNf8, TRT-MNd1, TRT-MNd11, TRT-MNd14, TRT-MNd15, TRT-MNd16, TRT-MNd17, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf13, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (1,664 polygons)
Deer Movement Corridors Figure D-29	SWT-Cm1, SWT-Cm2, SWT-Cm3, SWT-Co1, SWT-Co4, SWT-Co5, SWT-Co6, SWT-Co8, SWT-Hm1, SWT-Hm10, SWT-Hm12, SWT-Hm2, SWT-Hm5, SWT-Hm8, SWT-Ho1, SWT-Ho2, SWT-Ho3, SWT-Mm1, SWT-Mm4, SWT-Mm6, SWT-Mo1, SWT-Mo2, SWT-Mo3, SWT-Mo6, TRT-CNd1, TRT-CNd3, TRT-CNd4, TRT-CNd6, TRT-CNd8, TRT-CNf1, TRT-CNf3, TRT-CNf6, TRT-HNd1, TRT-HNd10, TRT-HNd3, TRT-HNd7, TRT-HNd8, TRT-HNf1, TRT-HNf11, TRT-HNf18, TRT-HNf39, TRT-HNf40, TRT-HNf5, TRT-HNf8, TRT-MNd1, TRT-MNd15, TRT-MNd18, TRT-MNd2, TRT-MNd3, TRT-MNd4, TRT-MNd5, TRT-MNd6, TRT-MNd7, TRT-MNd8, TRT-MNf1, TRT-MNf10, TRT-MNf11, TRT-MNf12, TRT-MNf2, TRT-MNf3, TRT-MNf4, TRT-MNf7, TRT-MNf8, TRT-MNf9 (928 polygons)

List of Appendix Tables

GLOSSARY AND ABBREVIATIONS

AOI	Area of Interest
AHM	Aquatic Habitat Mapping
ARA	Aquatic Resource Area
BIS	Biodiversity Impact Studies
BPD	Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design
BPPA	Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach
BV	Biodiversity Value; The biotic environmental components that will be considered for study within the Project's Biodiversity Impact Studies. A subset of biodiversity values will ultimately be scoped into the Biodiversity Impact Assessment as Valued Components.
CNSC	Canadian Nuclear Safety Commission
Critical Habitat	Habitat that is necessary for the survival or recovery of a listed wildlife species and that is identified as the species' critical habitat in the recovery strategy or in an action plan for the species (*Species at Risk Act*, S.C. 2002, c. 29). Identification of critical habitat is not a required component of a recovery strategy under the Ontario *Endangered Species Act*. However, the approach used to identify critical habitat, in conjunction with the best scientific information available, is recommended when developing a habitat regulation. A habitat regulation is a legal instrument under the *ESA* that prescribes an area that will be protected as the habitat of the species.
DFO	Fisheries and Oceans Canada
Ecosite	Second lowest level of the Ecological Land Classification hierarchy. The land within an ecosite will generally contain similar substrate and vegetation.
eDNA	Environmental DNA
EMBP	Environmental Media Baseline Program
GRTS	Generalized Random Tessellation Stratified
GSWC	Greenock Swamp Wetland Complex
IA	Impact Assessment
IAAC	Impact Assessment Agency of Canada
Lake	An open waterbody with a depth greater than 2 m and with less than 25% of its surface area covered with wetland vegetation. For the purposes of study design lakes were also defined as being >1 ha in size.
LSA	Local Study Area
LSA_{AQU}	Aquatic Local Study Area

Marl	Soft, light-coloured (white to pale gray) mud-like sediment, typically in shallow waters of some small lakes or ponds, or under swamp lands, where it is often covered by black organic sediment.
MNRF	Ontario Ministry of Natural Resources and Forestry
MTO	Ontario Ministry of Transportation
NWMO	Nuclear Waste Management Organization
OHN	Ontario Hydro Network
OSAP	Ontario Stream Assessment Protocol
OWES	Ontario Wetland Evaluation System
Pond	A small body of still water formed naturally or by hollowing or embanking. Ponds differ from lakes in that they do not have an atrophic zone (an area deep enough that sunlight cannot reach the bottom). For the purposes of study design ponds were also defined as being ≤1 ha in size.
RIC / RISC	Resources Inventory Committee / Resources Information Standards Committee
Riparian Zone	Riparian zone includes riparian habitat from approximately 1.5 m upshore of the shoreline to 100 m upshore of the shoreline. Three riparian zones were delineated for data collection purposes: i) 1.5 – 10 m; ii) 11 – 30 m; and iii) 31 – 100 m.
RSA	Regional Study Area
RSA_{AQU}	Aquatic Regional Study Area
SAR	Species at Risk
SARA	Federal *Species at Risk Act*
Shoreline Cover	Shoreline cover includes cover provided to fish and other biodiversity for shade, protection from predation, and opportunistic feeding. It includes overhanging vegetation and woody debris, in-water vegetation and woody debris, larger substrates such as boulder and cobble that provide larger interstitial spaces for hiding, deep pools and organic debris; all within 1.5 m of the shoreline.
SON	Saugeen Ojibway Nation
SON-South Bruce siting area	Used to describe the broader area surrounding the defined area within which the Project may be located. The SON-South Bruce siting area is the general area surrounding the Municipality of South Bruce and includes the traditional territory of Saugeen Ojibway Nation (SON) in southwestern Ontario.
SOP	Standard Operating Procedure
Sumac	Sumac Geomatics; air photo interpreter for the Project at SON-South Bruce
SVCA	Saugeen Valley Conservation Authority
SWOOP	South Western Ontario Orthophotography Project 2020

The Project	The Adaptive Phased Management Project ('the Project') is the Deep Geological Repository and other required infrastructure for the safe, long-term management of Canada's used nuclear fuel.
TISG	Tailored Impact Statement Guidelines
VC	Valued Component
Waterbody	Includes, lakes ponds, and wetlands that do not have a defined channel running through it.
Watercourse	A natural or artificial channel through which water flows and includes streams, rivers and wetlands that include a defined channel that flows through them.
Wetland	Areas where the water table is at or near the surface, or where soils are saturated with water for sufficient time such that the principal determinants of vegetation and soil development are excess water and low oxygen. Wetlands are defined as being less than 2 m in depth and having greater than 25% of its surface covered with wetland vegetation.

1.0 BACKGROUND

The Adaptive Phased Management Project (hereafter, 'the Project') must be studied and assessed for its potential to impact fish and fish habitat. Aquatic habitats and the species, ecological services, and recreational opportunities they support are valued by land users, Indigenous communities, and the public for social, recreational, commercial, domestic, and spiritual reasons. Fishing is a popular activity in Southwestern Ontario, highlighting the important link between biodiversity values, ecosystem services, and socio-economic impact considerations. Fish habitat, which includes any watercourse, waterbody, or wetland that provides functions for the life history stages of fish, is protected by the *Fisheries Act* (R.S.C. 1985, c. F-14; updated in 2019). Habitats that support fish species and other aquatic and semi-aquatic species listed under the federal *Species at Risk Act (SARA;* S.C. 2002, c. 29) or the Ontario *Endangered Species Act* (S.O. 2007, c. 6) may be afforded further habitat protections. In addition, aquatic habitats that are defined as Significant Wildlife Habitat in the Ontario Provincial Policy Statement (MMAH 2020) under the *Planning Act* are also afforded protection (see Appendix C, Chapter 1).

The Canadian Nuclear Safety Commission's (CNSC) *Guidance on Deep Geological Repository Site Characterization* includes fish habitat as an element of aquatic ecology that should be characterized in the Area of Interest (AOI) (CNSC 2018). In addition, the Tailored Impact Statement Guidelines Template ('TISG Template'[1]) identifies fish and fish habitat as elements of the biophysical environment (IAAC 2022) that could be scoped into the Impact Assessment (IA) as Valued Components (VCs), which would require a detailed baseline description and project effects assessment in the impact statement (IAAC 2020). The characterization of fish habitat will also serve to describe the available habitat required by semi-aquatic species (such as amphibians and turtles).

1.1 Objectives

The primary objectives of the aquatic habitat mapping (AHM) for the Biodiversity Impact Studies (BIS) at the Saugeen Ojibway Nation (SON)- South Bruce siting area are to:

1. Characterize the presence and distribution of fish habitat within the AOI and the aquatic Local Study Area (LSA_{AQU}; Section 3.2, Chapter 1);
2. Detect areas of importance to aquatic and semi-aquatic biodiversity values (BVs), including habitat potentially used to carry out various life history requirements and habitats that could support species at risk (SAR)[2] and other species of interest in the LSA_{AQU};
3. Identify suitable sampling sites for Tier 2 studies for aquatic and semi-aquatic BVs (including sampling sites within the LSA_{AQU} and control sites within and outside of the aquatic regional study area (RSA_{AQU}); and
4. Provide additional baseline data to inform infrastructure siting and a potential future Impact Assessment, mitigation measures, and associated monitoring program(s) to address the environmental, regulatory, and stakeholder/rights-holder concerns relevant to the Project.

[1] See Chapter 1 for limitations and updates to the TISG Template.

[2] See Appendix D and Section 3.1 in Zoetica's BPPA Report (Zoetica 2021) for a comprehensive list of SAR, and methods used to compile this list.

The AHM studies begin to fulfill the requirements of the TISG Template for fish and fish habitat as well as TISG requirements for describing habitat for other aquatic and semi-aquatic wildlife (see Appendix C in Zoetica™'s *Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach* (BPPA) Report (Zoetica 2021)). The AHM began with a desk-based mapping exercise, followed by field surveys. The initial desk-based AHM provided draft watercourse reach delineations and identified areas where potential barriers to fish passage may exist. Desk-based mapping may also provide an overview of suitable habitat for fish to complete various life history stages and potential sensitivity of habitats to future change throughout the area. Field surveys improve desk-based mapping by verifying connectivity between waterbodies, identifying potential ephemeral aquatic habitats and flooded areas, and collecting information on habitat features (sediment, vegetation, and bank characteristics) at a sub-set of reaches. Collecting these data during Tier 1 studies will inform where future detailed habitat characterization may be required and where Tier 2 fish community characterization studies should be conducted.

1.2 Best Practices

A full description of best practices considered for the AHM study design is available in the BPPA Report (Zoetica 2021). Methods outlined in the Ontario Stream Assessment Protocol (OSAP (Stanfield 2017)) and the Ontario Ministry of Transportation's (MTO) *Environmental Guide for Fish and Fish Habitat* (MTO 2009) were used for desk-based watershed mapping and field verification. These methods were supplemented with the *Reconnaissance (1:20 000) Fish and Fish Habitat Inventory: Standards and Procedures* (RIC 2001). The Resource Inventory Committee (RIC) standards (RIC 2001) are designed to assess desk-based AHM at a more detailed scale (1:20,000) relative to methods described in Ontario protocols, and are generally more comprehensive.

2.0 STUDY AREAS

AHM was conducted to collect aquatic habitat information within the area of interest (AOI) and the aquatic local study area (LSA_{AQU}), and within select areas outside of the LSA_{AQU}. Outside the LSA_{AQU}, sites within and outside the aquatic regional study area (RSA_{AQU}) (see Section 3.0, Chapter 1, for study area delineations) were included to capture appropriate control sites and areas known to support critical habitats for SAR. The BPPA Report (Zoetica 2021) also contains additional details on the rationale for delineating study areas.

3.0 METHODS

3.1 Collation of Habitat Data

Desk-based investigations began with collating existing information from government, citizen science, and other datasets on aquatic habitat (e.g., existing barriers) that could potentially occur within the BIS study areas. **Table 3-1** summarizes the datasets, data layers, and reports investigated and analyzed for aquatic habitat data for the 2023 BIS Baseline Report. See also Appendix A, Chapter 1 for data quality scoring of datasets. A full list of the species mentioned in this report, including common and scientific names, is available in **Table H-1** in Appendix H.

Table 3-1. Spatial datasets and reports analyzed for aquatic habitat for the 2023 BIS Baseline Report.

Data Source / Owner	Dataset	Data Format	Date Accessed / Received	Contains relevant[1] data?
Zoetica / Sumac Geomatics *BIS Tier 1 studies*	Ecosite Classification Dataset	Shapefile	07/2020	Y
Ontario Ministry of Natural Resources and Forestry (MNRF)	Beaver Dam - discontinued (GeoHub)	Shapefile	10/2021	Y
	OHN Hydrographic Line	Shapefile	10/2021	Y
	OHN Hydrographic Point	Shapefile	10/2021	Y
	OHN Hydrographic Polygon	Shapefile	10/2021	N

Note:
1. Zoetica determined dataset relevance based on geographic and temporal relevance, as well as relevance to aquatic habitats. For example, data that were not within the relevant BIS study areas, and data that were too old to be considered relevant were labelled "N".

If Zoetica identifies additional datasets that are relevant to aquatic habitat in the applicable study areas, they will be investigated and incorporated into baseline data maps in future years of the BIS baseline program. Any future projects that overlap with the BIS study areas may provide data or identify data sources that can be integrated into future iterations of baseline reports. Additional projects that may come online and overlap with the RSA_{AQU} will be considered in future years where relevant.

3.2 Habitat Classifications

AHM mapping uses watercourses and waterbodies as the most coarse-grained definitions of aquatic features. Using AHM Best Practices outlined in the BPPA report (Zoetica 2021), wetlands are defined as watercourses if they have a defined channel and are otherwise defined as waterbodies. Zoetica divided protocols for characterizing aquatic habitats into survey methods for: (1) watercourses (including wetlands with distinct channels flowing through them) and (2) waterbodies such as lakes, ponds, and wetlands (without distinct channels).

3.3 Desk-based Reach Characterization

Before fieldwork, Zoetica conducted desk-based aquatic reach mapping using available data and orthophotos to classify aquatic habitat in the LSA_{AQU} into watercourse (streams and rivers), waterbody (lakes and ponds) and wetland reaches. Additional watercourses and waterbodies in and outside of the RSA_{AQU} were classified in select areas for use as potential control sites. The data sources used in the reach characterization included:

- Ontario Hydro Network (OHN) products, which include a watercourse and waterbody layer (available from Ontario GeoHub and mapped at a scale of 1:20,000 in Southern Ontario);
- Ontario Ministry of Natural Resources and Forestry (MNRF) Wetlands dataset (available from Ontario GeoHub); and
- South Western Ontario Orthophotography Project (SWOOP) Imagery collected in April 2020, used to classify the landscape into ecosites and define wetlands (see Appendix B, Chapter 1 for details).

See Appendix A, Chapter 1 for data quality scoring.

Sumac Geomatics interpreted the SWOOP air photos to create the ecosite classification dataset only within the natural and naturalized areas of the LSA_{AQU} (see Appendix B, Chapter 1), with the potential to expand into other areas in future years. Zoetica used ecosite classification dataset to delineate waterbodies and wetlands within the LSA_{AQU} for consistency across all BIS programs and due to the dataset's increased accuracy relative to the MNRF and OHN Waterbody datasets. However, as the ecosite classification dataset was limited to the LSA_{AQU}, Zoetica used the OHN Waterbodies and MNRF Wetlands datasets to characterize reaches outside the LSA_{AQU}. Wetland ecosites in the ecosite classification dataset were grouped into four major wetland groups that are consistent with the Ontario Wetland Evaluation System (OWES) (MNRF 2014): fen, bog, swamp, and marsh. The MNRF Wetlands dataset used in the RSA_{AQU} contains the same wetland groups, plus an additional 'unknown' wetland group.

3.3.1 Watercourses

Zoetica delineated watercourse reaches manually using the OHN Watercourse layer as a base map. Reaches are sections of a stream or river with uniform characteristics and reach boundaries signify locations where these characteristics change. Where needed, Zoetica digitally edited the watercourses to align them better with SWOOP 2020 imagery. Reach boundaries were delineated based on:

- River confluences (e.g., where a tributary meets a larger river);
- A distance of at least 100 m from the last boundary (unless tributaries were closer than 100 m);
- Locations where watercourse channel patterns change (e.g., change from straight to meandering);
- Locations where watercourse habitat attributes change (e.g., change from no wetland to a wetland, change in wetland type, or change in the size of the wetland surrounding the watercourse);
- Locations where the permanently vegetated islands change (e.g., no islands to occasional islands); and
- Locations where the confinement changes (e.g., change from unconfined to occasionally confined).

Zoetica considered obstructions or potential barriers to fish passage to be reach boundaries if their lengths were less than either 100 m or 10 times bankfull width, and if they were consistent with changes in physical criteria (e.g., falls with characteristics different from both upstream and downstream reaches).

Reaches on a watercourse were assigned a unique number (in an upstream-ascending order), with the first reach defined at the mouth of the watercourse. Zoetica derived a preliminary watercourse reach table, including all second-order or greater reaches in the LSA_{AQU}, as well as reaches for control sites (e.g., along the Teeswater River upstream of the LSA_{AQU} and the Beatty Saugeen River), for planning purposes and to determine a subset of watercourse reaches to be field surveyed (see Section 3.4). Watercourse reaches selected for survey are summarized in a watercourse reach table in the *Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design* (BPD) Report (Zoetica 2022), which includes referencing and basic desk-based classification information (see Section 2.3 of the BPD Report (Zoetica 2022)). A breakdown of the number of watercourse reaches selected for survey is presented in **Table A-1**.

3.3.2 Waterbodies

Waterbodies within the AOI, LSA_{AQU}, and in select areas outside of the LSA_{AQU} (for selection of control sites) were first classified as:

- Lakes: open waterbodies with depths greater than 2 m, with less than 25% of surface area covered with wetland vegetation and > 1 ha in size; or

- Ponds: small bodies of still water formed naturally or by hollowing or embanking, and ≤ 1 ha in size. Ponds differ from lakes because they do not have an atrophic zone (an area deep enough that sunlight cannot reach the bottom).

Reaches were defined by the waterbody's extent (length). Zoetica assigned a unique reach number to each waterbody in an upstream sequential order and integrated with the watercourse reach numbering system. Zoetica derived a preliminary waterbody reach table, including all waterbody reaches in the LSA_{AQU} and select reaches for control sites within and outside of the RSA_{AQU} (i.e., Robson Lake, Hines Lake, and Cargill Mill Pond) for planning purposes and to determine a subset of reaches to be field surveyed (see Section 3.4). The waterbody reaches selected for survey are in a final waterbody reach table in the BPD Report (Zoetica 2022) which includes referencing information and basic desk-based information (see Section 2.3.2 of the BPD Report for further details (Zoetica 2022)). A breakdown of the number of waterbody reaches selected for survey is presented in **Table A-1**.

3.3.3 Wetlands

Wetlands are "*lands that are seasonally or permanently flooded by shallow water (i.e., with depths less than 2 m) or where the water table is close to the surface where the presence of abundant water has caused the formation of hydric soils and has favoured the dominance of either hydrophytic or water tolerant plants*" (MNRF 2014).

Zoetica used the ecosite classification dataset (see Appendix B, Chapter 1) to group all wetland ecosites within the natural and naturalized areas of the LSA_{AQU} into four types based on the OWES for Southern Ontario (MNRF 2013): marsh, swamp, fen, and bog. Swamps dominated the mapped area and were further divided into conifer, hardwood, mixedwood, and shrub swamps. No bogs were identified within the natural and naturalized areas of the LSA_{AQU}. Zoetica defined wetland reaches by the full extent of the wetland and assigned each wetland in the LSA_{AQU} a polygon ID. A preliminary table of wetland reaches in the LSA_{AQU} was derived for planning purposes and used to determine the subset of reaches to be field surveyed (see Section 3.4). The wetland reaches selected for survey are in a final waterbody reach table in the BPD Report along with referencing and basic desk-based information (see *Standard Operating Procedure for Aquatic Habitat Mapping - Southwestern Ontario Site* (AHM SOP; Appendix B of the BPD Report (Zoetica 2022)). A breakdown of the number of wetland reaches selected for survey is presented in **Table A-1**, excluding fen wetlands as they were not accessible during the 2022 field season.

3.4 Study Design and Survey Site Selection

In 2022, AHM data collection was focused on surveys within all types of aquatic habitats in the AOI and LSA_{AQU} and in select areas of the RSA_{AQU}. The BIS baseline program aims to survey all watercourses and waterbodies that the Project may directly impact within the AOI and LSA_{AQU} (e.g., the Teeswater River and lakes, ponds, and wetlands within the AOI and downstream of the AOI within the Greenock Swamp Wetland Complex), along with some control sites outside of the LSA_{AQU} (within the RSA_{AQU} and potentially beyond, as needed). However, the final Project location and design have not yet been determined. It is not feasible to survey all watercourses and waterbodies in the AOI, select areas of the LSA_{AQU}, and control sites in the RSA_{AQU} in a single field season. The survey design for 2022 included a subset of all aquatic habitat types in the AOI, representative areas of the LSA_{AQU}, and potential control sites. A full description of the watercourse, waterbody, and wetland reach selection, and rationale is provided in the 2022 BPD Report (Zoetica 2022). Additional surveys can be undertaken in future years once more information about the Project is known (including location, components, activities, and predicted extent of potential

impacts) and based on results from initial environmental DNA (eDNA) metabarcoding studies (see Appendix E, Chapter 1).

3.4.1 Watercourses

Zoetica's study design for 2022 focused on surveying a subset of watercourse reaches in the AOI that were in second-order or higher streams, along with rivers and first-order tributaries where SAR were detected before BIS baseline studies began. Zoetica also included surveys on second-order or higher reaches of the Teeswater River downstream of the AOI, and within reaches on tributaries to the Teeswater within the Greenock Swamp Wetland Complex (GSWC). Additional far-reaching sites were included on the Teeswater River outside GSWC and downstream of the LSA_{AQU}. Reaches upstream of the AOI on the Teeswater River and Alps Creek were also selected to act as potential control locations for reaches within the AOI. A breakdown of the number of sites selected for survey can be found in **Table A-1** in **Appendix A**. Full details for the selection of watercourse reaches and survey locations for the 2022 BIS study design can be found in the 2022 BPD Report (Zoetica 2022).

3.4.2 Waterbodies

In 2022, Zoetica's study design focussed on surveying all accessible lakes and ponds within the AOI and all large, named lakes in the LSA_{AQU}, all of which occur within the GSWC. However, Cunningham Lake was deemed to be inaccessible and unsafe for survey based on feedback received from the Saugeen Valley Conservation Authority (SVCA) indicating that this lake is surrounded by a floating bog; thus, it was excluded from the study design. Zoetica may look at other ways to assess habitat at Cunningham Lake if the SON-South Bruce site is selected. Additional unnamed lakes/ponds were selected for survey within the LSA_{AQU} but outside of the AOI. Cargill Mill Pond was included for survey in the RSA_{AQU} because it is known to contain critical habitat for pugnose shiner and occurs downstream of the AOI and LSA_{AQU} on the Teeswater River. In addition, Robson and Hines lakes were selected outside of the RSA_{AQU} as potential control sites for the large, named lakes within the GSWC. A breakdown of the number of sites selected for survey can be found in **Table A-1** in **Appendix A**. Full details for selecting waterbody reaches and survey locations for the 2022 BIS study design can be found in the 2022 BPD Report (Zoetica 2022).

3.4.3 Wetlands

In 2022, Zoetica's study design prescribed surveys of approximately one-third of wetlands within the AOI (see Section 2.3.2.3.1.3 in the 2022 BPD Report (Zoetica 2022)). A stratified random study design (i.e., Generalized Random Tessellation Stratified (GRTS)) was used to select potential wetland survey sites in the AOI based on selecting all polygons of rare wetland types (conifer swamp and shrub swamp) and then proportional representation of the remaining wetland types (hardwood swamp, mixedwood swamp, marsh) resulting in 30 wetland sampling locations in the AOI. In the southern LSA_{AQU} a proportionally equal number of wetland sites were paired to the same wetland types as those found within the AOI. For example, 30% of sites selected within the AOI were represented by hardwood swamps, thus, a similar proportion of hardwood swamps were selected south of the AOI. In the southern LSA_{AQU}, a total of 26 survey sites were selected. An additional 25 survey sites were chosen in the LSA_{AQU} north of the AOI. Each wetland type had at least two survey locations, and the remaining survey locations were allocated to wetland types to approximately match the proportion of the mapped area north of the AOI that was covered by each wetland type. Full details on the selection of wetland reaches and survey locations for the 2022 BIS study design can be found in the 2022 BPD Report (Zoetica 2022).

3.5 Field Survey Methods

Field-based AHM was conducted using methods outlined in the AHM SOP (Appendix B of the BPD Report (Zoetica 2022)). These methods primarily followed steps found in the OSAP, enhanced using procedures outlined in the MTO's *Environmental Guide for Fish and Fish Habitat* (MTO 2009), and the *Reconnaissance (1:20 000) Fish and Fish Habitat Inventory: Standards and Procedures* (RIC 2001). Field mapping was conducted at watercourse, waterbody, and wetland sites according to the AHM SOP (Zoetica 2022), and at major inflow and outflow of select lakes and ponds. Field methods focused on checking the accuracy of reach delineations derived via desk-based mapping (outlined in Section 3.3) and included collecting detailed habitat characteristics that could not be ascertained using aerial imagery alone. Field methods were also aimed at collecting habitat information to predict whether habitat is suitable for supporting fish species of interest during various life history stages, to inform methods needed for fish presence and community surveys in future baseline fieldwork (i.e., Tier 2 studies), to identify where detailed fish and fish habitat assessments will likely be required (e.g., SAR habitat, habitat that may be lost or altered due to the Project), and to identify areas to avoid and potential areas suitable for offsetting, should a future IA illustrate a need.

3.5.1 Survey Timing

Aquatic habitat field surveys were conducted between July 13th and September 29th, 2022, to characterize watercourse, waterbody, and wetland habitat information. This timing window follows the standard survey period for AHM in Ontario (MTO 2009, Stanfield 2017). The survey timing coincides with low flow periods to optimize visibility into the water and ensure that seasonal aquatic and riparian vegetation is present (MTO 2009). Surveys were conducted during weather conditions suitable for good visibility through the water column (i.e., not during or after periods of heavy rain and other weather events that can increase runoff, stir up sediments, and reduce water clarity).

3.5.2 Survey Crew

The Nuclear Waste Management Organization (NWMO) contracted North South Consultants Inc and their subconsultants (Morrison Hershfield) to conduct field surveys outlined in the BIS BPD Report (Zoetica 2022). The field contractor crews consisted of a minimum of two team members, including at least one vegetation specialist from Morrison Hershfield to identify riparian and aquatic vegetation.

3.5.3 Reconnaissance Survey

Zoetica recommended conducting a reconnaissance survey in the spring (after freshet) before field surveys to:

1. provide an overview of each watercourse reach and waterbody to be surveyed;
2. determine ephemeral connections;
3. determine whether reach breaks on watercourses required further subdivision (e.g., an unrecorded barrier is detected);
4. assist in selecting representative sites on reaches for survey; and,
5. confirm access plans based on satellite imagery.

Due to the late procurement of the field data collection contractor, a reconnaissance survey was not conducted before field surveys. Zoetica recommends a spring reconnaissance survey be conducted in future years to identify ephemeral streams and potential connections within the study area. During a preliminary site visit by Zoetica in June 2022, many areas on the eastern side of GSWC were dry. During

discussions with SVCA staff, Zoetica learned that the eastern side of the swamp is generally only wetted during the early spring. Zoetica suggests revisiting the GSWC during a future spring reconnaissance to determine the potential connectivity of wetland areas with the Teeswater River, to understand the potential use of the swamp by fish, and to understand the potential migration by fish species during the spring season.

3.5.4 Watercourse Surveys

At each watercourse reach (see Section 3.3.1 for reach definition), the field survey team selected a representative site for the survey. Sites were defined by a stretch of watercourse of a minimum of 40 m in length and beginning and ending at a crossover point (i.e., a half meander where the thalweg of the watercourse crosses to the opposite bank). At some sites, multiple crossover sites were required to define a survey site to achieve the minimum required survey length. For long straight reaches, where no obvious meanders occurred, the site length was determined using the formula: 10 x bankfull width unless the result is less than the 40 m minimum length criteria.

Detailed methods for completing surveys at watercourse sites, including required equipment, are outlined in the AHM SOP in Appendix B of the BPD Report (Zoetica 2022). At each watercourse survey site, five forms were filled out:

1. Reach Overview Form: including details of the survey crew, weather conditions, reach UTM coordinates, access, and determination of whether the reach is sampleable.
2. Reach Features Form: including notes on site conditions.
3. Watercourse Site ID and Mapping Form: including UTM coordinates of site boundaries and a hand sketch of the site and habitat conditions to scale.
4. Watercourse Characterization Form: including measurements of water conditions, reach section type and morphology (e.g., associated wetlands, gradient, discharge, reach subsections (run, pool, riffle, flats), substrate, and bank stability), cover and habitat measurements (instream and bank), and information on migratory obstructions, critical or limiting habitat, and enhancement opportunities.
5. Photograph Logsheet Form: to document photos taken at the site.

3.5.5 Waterbody Surveys

Waterbody surveys include a shoreline survey of the lake or pond reach and surveys of the main inlet and outlet of the waterbody (if the waterbody has an inlet or outlet). Inlets and outlets were surveyed following the watercourse methods and forms outlined in Section 3.5.4.

Detailed methods for completing the survey at waterbody sites, including required equipment, are outlined in the AHM SOP in Appendix B of the BPD Report (Zoetica 2022). During the shoreline survey, the same five survey forms listed in Section 3.5.4 were filled out, except that the mapping form was specific for each waterbody and included a georeferenced form to accommodate hand sketches of shoreline habitat. In addition, a waterbody characterization form replaces the watercourse characterization form and includes fields for information within shoreline zones depicted by changes in shoreline habitat.

3.5.6 Wetland Surveys

For wetlands, the minimum information collected at each survey location included site referencing, cover estimates, water quality, habitat characteristics and photography of the site. Wetland reaches where the

open water formed a channel through the wetland were surveyed following the watercourse survey methods and forms.

Survey site selection within a wetland polygon was primarily determined by using Geographic Information System software (QGIS) to randomize the location of the survey site within the wetland polygon. However, the field contractor was instructed to move the selected GRTS point to the nearest wetted area for AHM surveys and collecting eDNA samples (see Appendix E, Chapter 1).

Detailed methodology for completing the survey at wetland sites, including required equipment, is outlined in the AHM SOP in Appendix B of the BPD Report (Zoetica 2022). During the wetland survey, the same five survey forms listed in Section 3.5.4 were filled out, except a wetland mapping form and wetland characterization form replace the watercourse mapping and characterization forms.

3.6 Data Analysis

Field data, once quality checked by the field data collection contractor, were provided to Zoetica for data analysis and interpretation. Data received by Zoetica were assumed to be cleaned following a QA/QC procedure undertaken by the field contractor and error-free. A summary of reaches surveyed by the field contractor is provided in **Table A-1**. Many reaches visited during field efforts were dry at the time of survey and thus excluded from the analysis. Additional reaches planned for survey were not visited due to landowner permissions not received in time for survey or due to unsafe conditions (e.g., flooding of land). These reaches may be surveyed in future years if conditions allow.

3.6.1 Watercourses

Zoetica uploaded field data into R statistical software and cleaned the files of any errors (e.g., formatting errors, spelling consistency errors). Zoetica separated unsampled and dry sites from sampled sites, and further separated sampled sites into categories based on location (AOI, LSA_{AQU}, RSA_{AQU}, and Reference) and watercourse (e.g., Unnamed, Teeswater River, Alps Creek). For LSA_{AQU} and RSA_{AQU} sites on the Teeswater River, Zoetica combined the sites into three groups based on their locations relative to each other: sites S049 and S078 upstream of the AOI within the LSA_{AQU}, sites S031 and S019 downstream of the AOI within the RSA_{AQU}, and the remaining 11 sites downstream of the AOI within the LSA_{AQU}. A list of site IDs by each category is provided in **Table A-2**. For water chemistry variables (water temperature, pH, conductivity, turbidity, dissolved oxygen) and waterbody length, width, and depth, Zoetica calculated mean, minimum, maximum, and standard error. For numeric habitat variables (e.g., substrate type), Zoetica calculated minimum, mean, maximum, and standard deviation. Zoetica summed total site lengths for each watercourse-location combination. For categorical habitat variables (e.g., source type, percent stream shaded, bank stability, bank stage), Zoetica tallied the count and percent of sites in each category. Dominant vegetation type at different locations in the riparian zone[3] were summarized by percent of sites reporting each distance-vegetation type category.

[3] Riparian zone includes riparian habitat from approximately 1.5 m upshore of the shoreline to 100 m upshore of the shoreline. Three riparian zones were delineated for data collection purposes: i) 1.5 – 10 m; ii) 11 – 30 m; and iii) 31 – 100 m.

3.6.2 Waterbodies

Data were uploaded and cleaned as in Section 3.6.1. Zoetica separated unsampled and dry sites from sampled sites, and further separated sampled waterbodies into groups of unnamed lakes in the AOI, unnamed lakes outside of the AOI, reference lakes (Hines, Robson, and Cargill), and other named lakes / lakes in and near Greenock Swamp (Silver, Schmidt, and Oppleck). A list of site IDs by each category is provided in **Table A-2**. Some habitat variables were reported for the overall waterbody. For waterbody-wide water chemistry and spatial variables (water temperature, pH, conductivity, turbidity, dissolved oxygen, waterbody length, width, and depth), Zoetica calculated mean, minimum, maximum, and standard error. For numeric habitat variables (e.g., shoreline cover[4]), Zoetica calculated minimum, mean, maximum, and standard deviation. For categorical habitat variables (e.g., flow type), Zoetica tallied the count of sites in each category.

Zoetica provided the field data collection contractor a customized mapping form for each waterbody, which included an outline of the waterbody to aid the accuracy of the hand-drawn mapping in the field. In addition to the drawn maps, the field surveyors supplied Zoetica with spatial datasets of the perimeter of each lake and where the zone breaks occur. Using the drawn map forms, the lake perimeter spatial dataset, and SWOOP imagery, Zoetica delineated zone breaks to split the riparian buffers (i.e., 1.5 - 10, 11 - 30, and 31 – 100 m) into zones. The associated field data was joined to each zone and mapped. In addition to the zone breaks, Zoetica digitized other information from the hand-drawn map forms, including vegetation types, barriers, potential locations for future fieldwork, and other features of interest.

3.6.3 Wetlands

Data were uploaded and cleaned as in Section 3.6.1. Zoetica separated unsampled and dry sites from sampled sites, and further grouped sampled sites based on location – AOI, north of the AOI, and south of the AOI – and wetland type for summarizations. A list of site IDs by each category is provided in **Table A-2**. For each study area-wetland type combination, Zoetica calculated mean, minimum, maximum, and standard error for water chemistry variables (water temperature, pH, conductivity, turbidity, and dissolved oxygen). For numeric habitat variables, such as substrate type, Zoetica calculated minimum, mean, maximum, and standard deviation. Categorical habitat variables, such as reach type, were tallied to report an overall count per category. Dominant vegetation type at different locations in the riparian zone were summarized by percent of sites in each distance-vegetation type category.

4.0 RESULTS

This section presents desk-based AHM results and field results from the first year of Tier 1 data collection at the SON-South Bruce location.

[4] Shoreline cover includes cover provided to fish and other biodiversity for providing shade, protection from predation, and opportunistic feeding and includes overhanging vegetation and woody debris, in-water vegetation and woody debris, larger substrates such as boulder and cobble that provide larger interstitial spaces for hiding, deep pools and organic debris all within 1.5 m of the shoreline.

4.1 Habitat

4.1.1 Watercourses

A total of 80 sites (including inlet and outlet reaches to lakes) containing water were surveyed on watercourse reaches within the AOI, LSA_{AQU}, and RSA_{AQU} to document aquatic habitat. Three wetlands were reclassified as streams during AHM surveys and are summarized along with watercourse reaches in this section. Sections 4.1.1.1 and 4.1.1.2 describe habitat characteristics recorded within each of the watercourse groupings surveyed. Habitat characteristics are presented in **Appendix B**. Riparian and aquatic vegetation (common and scientific names) documented during AHM surveys of watercourses and mentioned in this report are presented in **Appendix G.**

4.1.1.1 Teeswater River

The Teeswater River has an overall length of 89.5 km and a slope of approximately 1.5 m/km from its headwaters to its mouth where it empties into the Saugeen River, which then flows towards Lake Huron. The Teeswater flows from its headwaters through the AOI and into the GSWC north of the AOI. The Teeswater is anticipated to have strong flows in the fall and spring, due to heavier rainfall and snow melt, respectively, with groundwater base flow during the summer. The Teeswater River has a cold/cool water regime with tributaries that are cold, cool, or warm. According to the Aquatic Resource Area (ARA) database (MNRF 2021), sections of the Teeswater River between its headwaters and the GSWC are known to be cold water and change to cool water from the GSWC to approximately the Cargill Mill Ponds; sections of the Teeswater north of the Cargill Mill Ponds are known to have a warm water thermal regime.

The Teeswater River is a popular fishing stream in southwestern Ontario for smallmouth bass, northern pike, and white crappie. The Teeswater River is known to support populations of rainbow mussel, a freshwater mussel species listed as endangered under Schedule 1 of the *SARA*, and pugnose shiner, a species listed as Threatened under Schedule 1 of the *SARA*. Critical habitat for pugnose shiner has been defined in its Federal recovery strategy near the town of Cargill at the Cargill Mill Ponds (DFO 2012). Pugnose shiner prefer habitats that are highly vegetated with sandy or marl substrate and low turbidity (OMNR 2013).

4.1.1.1.1 Teeswater River in the AOI

In the AOI, field crews surveyed a total of 22 sites along the Teeswater River for aquatic habitat characteristics. The Teeswater River within the AOI has permanent flow with low discharge and primarily a natural stream channel with structure with only one site (S038) being channelized (**Table B-1**). Water chemistry in reaches of the Teeswater River in the AOI is presented in **Table B-2**. This section of the Teeswater River had a mean temperature of 21.6 ± 0.3 °C, normal pH (between 6.5 and 8.2) and conductivity (between 200 – 1000 µS/cm), moderate to high turbidity (between 8 and 50 NTU), and a healthy dissolved oxygen profile (of above 8 mg/L and 80%).

Examples of habitat and features on the Teeswater River within the AOI are presented in **Figure 4-1**. Associated wetlands along this section of the Teeswater River are presented on **Figure B-1**. Shore cover providing shade on reaches on the Teeswater in the AOI was < 30% and riparian stage was primarily mature forest (**Table B-3**). Riparian vegetation within 10 m of the Teeswater River in the AOI consisted primarily (> 90%) of meadow followed by shrub (ca. 27 – 36%) and wetlands (ca. 23%) with smaller proportions of cropland, coniferous, deciduous, and mixed forests, and lawn (**Table B-4**; also see Figure D-4 in Chapter 3). Greater proportions of cropland and forest were found in the 11-30 m and 31-100 m

riparian zones from the watercourses (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of the reaches of the Teeswater surveyed in the AOI are presented in **Appendix G**. Habitat on the Teeswater River within the AOI is characterized primarily by flats, with riffle habitat occurring at four reaches (**Table B-5**; **Figure B-2**). Similar bankfull widths and depths were reported for flats and riffles along the Teeswater River in the AOI (**Table B-5**). Substrate in the Teeswater River within the AOI was comprised of a variety of substrate types (**Table B-5**; **Figure B-3**). Silt substrates were recorded on every reach surveyed, followed by clay, sand, and cobble (**Table B-5**). Reaches of the Teeswater in the southern portion of the AOI were primarily comprised of cobble sediments with smaller proportions of silt, sand, and gravel. Sediments gradually change to more silt and clay in the sections of the Teeswater in the central AOI and then change back to primarily cobble and silt with a small amount of clay as the Teeswater River exits the AOI in the northern portion.

All reaches surveyed within the Teeswater River in the AOI had some instream cover; however, instream cover was greatest for reaches in the northeastern portion of the AOI before the Teeswater River exits the AOI into the GSWC (**Figure B-4**). Of the instream cover types present, vascular instream vegetation was present at 21 of the 22 sites surveyed and comprised a mean of approximately 18% of cover at these sites. Vascular overhanging vegetation and instream woody debris were also recorded frequently (at 17 of the 22 sites surveyed) but provided lower (approximately 4 - 5.5%) instream cover. Cobble was present at 15 of the sites surveyed but provided proportionally larger amounts of instream cover relative to other cover types (**Table B-5**). Other cover types were present at some of the sites surveyed but constituted proportionally lower amounts of instream cover (**Table B-5**). Aquatic vegetation was present at all reaches surveyed on the Teeswater River within the AOI, with all reaches containing emergent vegetation, 15 reaches containing submergent vegetation, and 11 reaches containing floating vegetation (**Table B-5**). Within the reaches containing aquatic vegetation, emergent vegetation was present in the greatest abundance followed by floating vegetation and then submergent vegetation (**Table B-5**). Predominant aquatic vegetation species recorded during AHM surveys in the Teeswater River within the AOI are presented in **Appendix G**.

a) Riffle habitat and woody debris on reach S007

b) Floating vegetation on reach S004

c) Cobble and gravel sediment on reach S016

d) Submergent vegetation on reach S074

e) Reach S069 deadended with road built up

f) Reach S070 filled in at road with cobble

Figure 4-1. Examples of reaches surveyed on the Teeswater River in AOI.

4.1.1.1.2 Tributaries to the Teeswater River within the AOI

Field teams surveyed a total of 21 reaches on tributaries to the Teeswater River within the AOI. Many of the smaller reaches on first order tributaries in the AOI were dry. Water chemistry of Teeswater tributary reaches in the AOI is presented in **Table B-2**. These tributaries had a mean temperature of 17.0 ± 1.0 °C, normal pH (between 6.5 and 8.2) and conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and a healthy dissolved oxygen profile (of above 8 mg/L and 80%).

Examples of habitat and features on tributaries to the Teeswater River within the AOI are presented in **Figure 4-2**. Associated wetlands along tributaries to the Teeswater River are presented on **Figure B-1**. Shore cover providing shade on reaches of the Teeswater tributaries in the AOI was variable and riparian stage was primarily mature forest (**Table B-3**). Riparian vegetation within 10 m of the Teeswater tributaries in the AOI consisted primarily (> 70%) of meadow followed by shrub and wetlands (ca. 33% each) with smaller proportions of coniferous, deciduous, and mixed forests, and cropland (**Table B-4**; also see Figure D-4 in Chapter 3). Greater proportions of cropland and forest were found in the 11-30 m and 31-100 m riparian zones from the watercourse (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the tributaries to the Teeswater River within the AOI are presented in **Appendix G**. Most Teeswater tributaries within the AOI contained flats, many (16 reaches) comprised riffle habitat and several (5 reaches) contained pool habitat (**Table B-5**; **Figure B-2**). Sediment within the smaller tributaries to the Teeswater River within the AOI consisted of a variety of substrate types (**Table B-5**). Sand substrates were recorded most often (at 18 reaches) followed by silt, muck, gravel, and cobble. Other substrate types were recorded at less than half of the reaches surveyed. Where present, muck substrates comprised the largest proportion of substrate types followed by silt and then sand. Larger substrate types were recorded in lower proportions relative to smaller substrates (**Table B-5**). Sediments in the smaller tributaries on the western side of the AOI were comprised mainly of muck and sand, with smaller amounts of detritus and gravel, while the tributary on the eastern side of the AOI had a variety of substrate types including cobble, gravel, silt, sand, clay, and muck (**Figure B-3**).

All reaches surveyed within the tributaries to the Teeswater River in the AOI had some instream cover. Vascular overhanging vegetation was present at all reaches surveyed and comprised a mean of approximately 28% of cover at these sites. However, vascular instream vegetation, where present (at 20 reaches), comprised the greatest proportion of cover (**Table B-5**). Undercut banks, cobble, deep pools, and instream woody debris also provided >10% cover at sites where present. Other cover types were present at some of the sites surveyed but constituted proportionally lower amounts of instream cover or were only present at a few reaches surveyed (**Table B-5**). Aquatic vegetation was present at most Teeswater tributary reaches surveyed within the AOI, with submergent and emergent vegetation recorded at 16 reaches and floating vegetation at 12 reaches (**Table B-5**). Overall, aquatic vegetation types were present in similar proportions (**Table B-5**). Predominant aquatic vegetation species recorded during AHM surveys in the tributaries to the Teeswater River within the AOI are presented in **Appendix G**.

d) An example of a tributary running through agricultural fields (S008)

e) An example of floating vegetation on reach S009 running through swamp habitat

f) An example of reach S100 near the confluence with the Teeswater River

Figure 4-2. Examples of reaches surveyed on tributaries to the Teeswater River in the AOI.

4.1.1.1.3 Teeswater River Upstream of the AOI

Upstream of the AOI, two sites were assessed along the Teeswater. Water chemistry in reaches of the Teeswater River upstream of the AOI is presented in **Table B-2**. This section of the Teeswater River had a mean temperature of 20.6 ± 0.2 °C, a slightly higher pH (>8.2), moderate conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and low dissolved oxygen (below 8 mg/L and 80%).

Examples of habitat and features on the Teeswater River upstream of the AOI are presented in **Figure 4-3**. Wetlands associated with this section of the Teeswater River are presented on **Figure B-1**. Shore cover providing shade on the two Teeswater reaches surveyed upstream of the AOI was < 30% and riparian stage was primarily young forest with some mature forest on the right upstream bank (**Table B-3**). Riparian vegetation within 10 m of the Teeswater River upstream of the AOI consisted entirely of meadow and deciduous forest (**Table B-4**; Figure D-4 in Chapter 3). Shrub and coniferous forest were found alongside meadow and deciduous forest in the 11-30 m and 31-100 m riparian zones adjacent to the watercourse (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of both Teeswater reaches upstream of the AOI are presented in **Appendix G**. Both reaches surveyed contained riffle habitat, one also contained flats and the other contained pool and run habitat (**Table B-5**; **Figure B-2**b). Sediments in this section of the Teeswater River were comprised primarily of cobble and gravel substrates with a smaller proportion of silt (**Table B-5**; **Figure B-3**). Both reaches surveyed within the Teeswater River upstream of the AOI had some in-stream cover (**Table B-5**; **Figure B-4**). Cobble was present at both sites and was present in the greatest proportion relative to other types of cover. Vascular instream vegetation and deep pools were also present at both reaches surveyed and provided a greater proportion of cover relative to other cover types. Boulders and overhanging vegetation were also present at both reaches surveyed but provided proportionally lower cover. Other cover types were present at only one of the reaches surveyed and provided proportionally smaller amounts of cover (**Table B-5**). All types of aquatic vegetation were present at both reaches surveyed on the Teeswater River upstream of the AOI, with submergent vegetation in greater proportion than emergent and submergent vegetation (**Table B-5**). Predominant aquatic vegetation species recorded during AHM surveys in the Teeswater River upstream of the AOI are presented in **Appendix G**.

a) Flats and riffles on reach S049

b) Cobble sediment on reach S049

c) In-water cover and vegetation in reach S078

d) Submergent vegetation on reach S078

Figure 4-3. Examples of reaches on the Teeswater River upstream of the AOI.

4.1.1.1.4 Teeswater River Downstream of the AOI within the LSA_{AQU}

Eleven reaches were surveyed on the Teeswater River downstream of the AOI but within the LSA_{AQU}. Water chemistry in reaches of the Teeswater River downstream of the AOI is presented in **Table B-2**. Reaches surveyed had a mean temperature of 20.3 ± 0.1 °C, normal pH (between 6.5 and 8.2) and conductivity (between 200 – 1000 µS/cm), moderate to high turbidity (between 8 and 50 NTU), and low dissolved oxygen (below 8 mg/L and 80%).

Examples of habitat and features within reaches surveyed on the Teeswater River downstream of the AOI within the LSA_{AQU} are presented in **Figure 4-4**. Wetlands associated with this section of the Teeswater River are presented on **Figure B-1**. Shore cover providing shade on reaches surveyed in the Teeswater downstream of the AOI was primarily 61 – 90% and riparian stage was mature forest (**Table B-3**). Riparian vegetation within 10 m of the Teeswater River downstream of the AOI consisted primarily of deciduous forest, wetlands, shrub, and meadow with smaller proportions of mixed forest (**Table B-4**; Figure D-4 in Chapter 3). Greater proportions of deciduous forest were found relative to wetlands, shrub, and meadow in the 11-30 m and 31-100 m riparian zones from the watercourse (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of the Teeswater reaches surveyed downstream of the AOI are presented in **Appendix G**. As the Teeswater River exists the AOI and enters the GSWC, habitat units are

comprised mainly of flats with the occasional pool habitat (**Table B-5**; **Figure B-2**). Sediments in the Teeswater River through the Greenock Swamp were primarily muck (at nine reaches surveyed) with small amounts of sand, silt, and clay (**Table B-5**; **Figure B-3**). Sediments change to primarily sand with smaller amounts of silt and clay as the Teeswater River exits the GSWC (**Figure B-3**). All 11 reaches surveyed had some instream cover (**Table B-5**; **Figure B-4**). Of the instream cover types present, overhanging woody debris and instream woody debris were present at all reaches surveyed and comprised the greatest proportion of cover. Vascular overhanging vegetation was also present at all reaches surveyed but provided lower proportion of cover relative to woody debris. Undercut banks, deep pools, and vascular instream vegetation were present at some of the sites surveyed but constituted proportionally lower amounts of instream cover (**Table B-5**). Aquatic vegetation was only present at a few reaches surveyed, with emergent vegetation recorded at two reaches and submergent and floating vegetation each recorded at only one reach (**Table B-5**). Overall, aquatic vegetation types, when present, were found in small proportions (**Table B-5**). Predominant aquatic vegetation species recorded during AHM surveys in the Teeswater River downstream of the AOI are presented in **Appendix G**.

a) An example of flat habitat on reach S002

b) An example of in-water cover on reach S058

c) An example of sediment on reach S046

d) Bank sloughing evident on reach S064

Figure 4-4. Examples reaches surveyed on the Teeswater River downstream of the AOI in the LSA_{AQU}.

4.1.1.2 Larger Tributaries to the Teeswater River

4.1.1.2.1 Alps Creek

Alps Creek is a cold-water tributary to the Teeswater River, which is in the southern portion of the LSA_{AQU}. Waters from the Teeswater Wetland Complex drain to Alps Creek and flow northward to the Teeswater River. Alps Creek was selected as a potential reference area for other tributaries to the Teeswater River that occur within the AOI.

A total of nine reaches were surveyed on Alps Creek. Alps Creek has a natural channel structure with permanent flow and a low to medium discharge (**Table B-1**). Water chemistry in reaches of Alps Creek is presented in **Table B-2**. Reaches surveyed on Alps Creek had a mean temperature of 16.6 ± 0.6 °C, a slightly elevated pH (> 8.2), normal conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and a healthy dissolved oxygen profile (of above 8 mg/L and 80%).

Examples of habitat and features on reaches surveyed in Alps Creek are presented in **Figure 4-5**. Wetlands associated with this section of Alps Creek are presented on **Figure B-1**. Shore cover providing shade on reaches surveyed in Alps Creek was variable and riparian stage was primarily mature forest with some young forest (**Table B-3**). Riparian vegetation within 10 m of Alps Creek consisted primarily of meadow and wetland followed by deciduous forest with smaller proportions of mixedwood forest, shrub, and conifer forest (**Table B-4**; Figure D-4 in Chapter 3). Similar proportions of these riparian vegetation types were found in the 11-30 m and 31-100 m riparian zones from the watercourse (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of reaches surveyed on Alps Creek are presented in **Appendix G**. Habitat along Alps Creek was characterized primarily by riffle and run (**Table B-5**; **Figure B-2**). Of the nine reaches surveyed, two contained pool habitat and six contained flats, of which one reach was comprised entirely of flats (**Table B-5**; **Figure B-2**). Sediment in reaches along Alps Creek were comprised of a variety of substrate types with cobble, and gravel comprising the dominant sediment types (**Table B-5**; **Figure B-3**). Cobble, gravel, and silt were present at all nine reaches surveyed. Smaller amounts of sand, silt, clay, and muck were also found at most reaches on Alps Creek. Boulder habitat was found in the three furthest upstream reaches surveyed.

All nine reaches surveyed had some instream cover (**Table B-5**; **Figure B-4**). Of the instream cover types present, cobble, instream woody debris, overhanging woody debris, vascular instream vegetation, and vascular overhanging vegetation were present at all reaches surveyed. Cobble and vascular instream vegetation comprised the greatest proportion of cover. Undercut banks were also present at eight of the nine reaches surveyed and provided proportionally large amounts of cover. Boulders, deep pools, and other types of cover were present at some sites in smaller proportions (**Table B-5**). Aquatic vegetation was present at all nine reaches surveyed, with submergent vegetation recorded at all reaches, emergent vegetation at seven reaches and floating vegetation at five reaches (**Table B-5**). However, where present, floating vegetation was recorded in proportionally greater amounts relative to submergent and emergent vegetation (**Table B-5**). Predominant aquatic vegetation species recorded during AHM surveys in Alps Creek are presented in **Appendix G**.

a) Reach S018 running through marsh habitat

b) Riparian shade at reach S018

c) Cobble and gravel sediment at reach S080

d) Woody debris at reach S045

e) In water woody debris at reach S081

f) Submergent vegetation at reach S047

Figure 4-5. Examples of reaches surveyed on Alps Creek.

4.1.1.2.2 Kinlough Creek

Kinlough Creek is a cool water tributary to the Teeswater River and is located within the GSWC. Waters from Silver Lake drain to Clam Lake and then into the Kinlough Creek before flowing through the southern portion of the GSWC and into the Teeswater River near Riversdale.

Four reaches were surveyed along Kinlough Creek. Kinlough Creek has a natural channel with permanent flow and low discharge (**Table B-1**). Water chemistry in reaches surveyed in Kinlough Creek is presented in **Table B-2**. Reaches surveyed in Kinlough Creek had a mean temperature of 19.6 ± 1.0 °C, normal pH (between 6.5 and 8.2) and conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and low dissolved oxygen (below 8 mg/L and 80%).

Examples of habitat and features in surveyed reaches in Kinlough Creek are presented in **Figure 4-6**. Wetlands associated with this section of Kinlough Creek are presented on **Figure B-1**. Shore cover providing shade on reaches surveyed in Kinlough Creek was variable and riparian stage was primarily mature forest with some young forest (**Table B-3**). Riparian vegetation within 10 m of Kinlough Creek consisted primarily of meadow and wetlands with smaller proportions of shrub, deciduous forest, and mixed forest (**Table B-4**; Figure D-4 in Chapter 3). Similar proportions of these riparian habitat types were found in the 11-30 m and 31-100 m riparian zones from the watercourse except for deciduous forest which was found in slightly greater proportion (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of reaches surveyed on Kinlough Creek are presented in **Appendix G**. Habitat along Kinlough Creek was characterized primarily by flats (**Table B-5**; **Figure A-1**). One reach surveyed on Kinlough Creek near where it meets the Teeswater River comprised riffle and pool habitat (**Figure B-2**). Sediment in Kinlough Creek was mainly muck substrate with small amounts of detritus present at three reaches and sand at one reach (**Table B-5**; **Figure B-3**).

All four reaches surveyed had some instream cover (**Table B-5**; **Figure B-4**). Of the instream cover types present, instream woody debris was present at all reaches surveyed. Overhanging woody debris and vascular instream vegetation were present at three of the reaches surveyed. Vascular instream vegetation comprised the greatest proportion of cover. Vascular overhanging vegetation was present at two reaches surveyed and was present in the greatest proportion relative to all other cover types (**Table B-5**). Aquatic vegetation was present at some of the reaches surveyed, with floating vegetation recorded at three reaches, and emergent and submergent vegetation each reported at two reaches (**Table B-5**). However, where present, submergent vegetation was recorded in proportionally greater amounts relative to floating and emergent vegetation (**Table B-5**). Predominant aquatic vegetation species recorded in reaches surveyed within Kinlough Creek are presented in **Appendix G**.

a) Flats on reach S026 b) Reach S030 with muck substrate

Figure 4-6. Examples of reaches surveyed on Kinlough Creek.

4.1.1.2.3 Schmidt Creek

Schmidt Creek is a cool water tributary to the Teeswater River located in the northeastern portion of the GSWC. Waters from Schmidt Lake drain into Schmidt Creek and flow southward and then eastward, draining into the Teeswater River south of Chepstow. In a map created in 2015 by Fisheries and Oceans Canada (DFO) outlining the distribution of mussel species at risk, rainbow mussels occurred within Schmidt Creek. However, the updated DFO Webmap does not show a distribution of any mussel SAR.

Three reaches were surveyed along Schmidt Creek. Two additional reaches (the inlet and outlet of Schmidt Lake) were dry at the time of survey. Schmidt Creek has a natural channel with permanent flow and low discharge (**Table B-1**). Water chemistry in reaches of Schmidt Creek is presented in **Table B-2**. Reaches surveyed in Schmidt Creek had a mean water temperature of 20.7 ± 1.3 °C, normal pH (between 6.5 and 8.2) and conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and low dissolved oxygen (below 8 mg/L and 80%).

Examples of habitat and features in surveyed reaches in Schmidt Creek are presented in **Figure 4-7**. Wetlands associated with this section of Schmidt Creek are presented on **Figure B-1**. Shore cover providing shade on reaches surveyed in Schmidt Creek was primarily between 31 – 60% with some reaches having 61-90% shade cover and riparian stage was mature forest (**Table B-3**). Riparian vegetation within 10 m of Schmidt Creek consisted primarily of wetland followed by deciduous forest and smaller proportions of meadow and shrub (**Table B-4**; Figure D-4 in Chapter 3). Greater proportions of deciduous forest relative to wetland were found in the 11-30 m and 31-100 m riparian zones from the watercourse (**Table B-4**; Figure D-4 in Chapter 3). Riparian species recorded on the shores of reaches surveyed on Schmidt Creek are presented in **Appendix G**. Habitat along Schmidt Creek at the three sites was characterized almost completely by flats (**Table B-5**; **Figure B-2**). One reach (S057) had a small amount (2%) of riffle habitat. Sediment in Schmidt Creek was comprised primarily of muck and detritus with one reach (S057) also containing sand and gravel (**Table B-5**; **Figure B-3**).

All three reaches surveyed had some instream cover (**Table B-5**; **Figure B-4**). Of the instream cover types present, instream woody debris, overhanging woody debris, vascular instream vegetation, and vascular overhanging vegetation were present at all reaches surveyed. Instream woody debris was present in the greatest proportion and vascular instream vegetation was present in the lowest proportion relative to all

cover types present (**Table B-5**). Aquatic vegetation was present in low proportion at two reaches surveyed, with floating vegetation recorded at one reach, and emergent vegetation reported at two reaches (**Table B-5**). Predominant aquatic vegetation species recorded in reaches surveyed within Schmidt Creek are presented in **Appendix G**.

a) Reach S037 demonstrating in-water cover

b) Reach S037 with abundant aquatic vegetation

c) Reach S044 running through swamp wetland

d) Culverts at reach S057

Figure 4-7. Examples of reaches surveyed on Schmidt Creek.

4.1.2 Waterbodies

A total of 16 lakes and ponds were surveyed within the AOI, LSA_{AQU}, and outside the LSA_{AQU} in the summer of 2022 (see **Table A-1**; **Figure A-2**). Perimeter surveys were conducted in lakes and ponds and the shoreline was characterized into zones based on differences in shoreline habitat. The major inlets and outlets (if wet) were also surveyed in all connected ponds and lakes. The sections below describe summarized habitat characteristics recorded within waterbodies in each study area. A summary of waterbody habitat characteristics is presented in **Appendix C**. Riparian and aquatic vegetation species

(common and scientific names) documented during AHM surveys of waterbodies are presented in **Appendix G.**

4.1.2.1 Lakes and Ponds in the AOI

A total of two waterbodies (one lake and one pond) were surveyed within the AOI during AHM surveys.

4.1.2.1.1 Lake L006

Lake L006 occurs in the northern portion of the AOI, north of the Teeswater River (see **Figure A-2**). Lake L006 is classified as an intermittently fed lake associated with marsh habitat and no known migratory obstructions (**Table C-1**a). At the time of survey, the outlet of the lake was dry. The lake does not have an inlet channel but rather is fed through a wetland at the north end of the lake. Water chemistry in Lake L006 is presented in **Table C-2**. Lake L006 had a mean water temperature of 14.3, normal pH (7.6) and conductivity (between 200 – 1000 µS/cm), low turbidity (below 8 NTU), and low dissolved oxygen (below 8 mg/L and 80%).

Examples of habitat and features in Lake L006 are presented in **Figure 4-8**. Habitat and features of interest mapped on Lake L006 during AHM surveys are presented in **Figure C-2**a. A total of four zones of differing shoreline habitat were ascribed to Lake L006 during field surveys. L006 was primarily surrounded by meadow except for a small amount of wetland habitat on the northwest side of the lake within the 1-10 and 11-30 m riparian zones, and mixedwood forest within the 31-100 m riparian zone (**Table C-3**; Figure D-4 in Chapter 3). Predominant riparian species recorded on the shores of L006 are presented in **Appendix G**. Lake L006 had a primarily vegetated shoreline type with a small amount of wetland shore on the northwestern side. Tall grasses were mapped on the southern side of the lake and significant riparian trees were mapped on the southwestern and northern sides of the lake. Additional riparian trees were noted on a peninsula on the western side of the lake and a cedar tree and dead standing tree were noted on an island within Lake L006 (**Figure C-2**a). Shoreline sediment consisted primarily of muck substrate with much smaller amounts of cobble, gravel, silt, and sand. A variety of shoreline cover primarily consisting of overhanging vascular macrophytes and in-water vascular macrophytes were present in Lake L006 (**Table C-4**a). Smaller amounts of cover were provided by boulders, cobble, in-water woody debris and overhanging woody debris. Lake L006 had a moderate amount of aquatic vegetation with 30% submergent vegetation, 10% emergent vegetation, and 5% cover as floating vegetation present (**Table C-4**a). Floating vegetation was mapped primarily in a large patch on the western side of the lake. Predominant aquatic vegetation species recorded in Lake L006 during AHM surveys are presented in **Appendix G**.

a) Shoreline habitat consisting of meadow and forest

b) In-water cover and aquatic vegetation present at L006

Figure 4-8. Examples of habitat on Lake L006.

4.1.2.1.2 Pond P010

Pond P010 occurs in the southern portion of the AOI, southwest of the Teeswater River (see **Figure A-2**). Pond P010 is classified as a pond fed by runoff and was associated with marsh habitat and no known migratory obstructions (**Table C-1**a). The outlet of the pond was dry at the time of survey. Water chemistry in Pond P010 is presented in **Table C-2**. Pond P010 had a mean water temperature of 24.0 °C, normal pH (7.6), low turbidity (below 8 NTU), and low dissolved oxygen (below 8 mg/L and 80%). Pond P010 did not have a recorded conductivity measurement.

Examples of habitat in Pond P010 are presented in **Figure 4-9**. Habitat and features of interest mapped on Pond P010 during AHM surveys are presented in **Figure C-3**. A total of two zones of differing shoreline habitat were ascribed to Pond P010 during field surveys. Pond P010 was primarily surrounded by meadow except had a small amount of wetland habitat on the northwest side of the lake within the 1-10 and 11-30 m riparian zones and mixedwood forest within the 31-100 m riparian zone (**Table C-3**; Figure D-4 in Chapter 3). Predominant riparian species recorded on the shores of Pond P010 are presented in **Appendix G**. Pond P010 had a primarily vegetated shoreline type with a small amount of wetland shore on the northwestern side. Shoreline sediment consisted primarily of muck substrate with much smaller amounts of cobble, gravel, silt, and sand. Shoreline cover in P010 primarily consisted of in-water vascular macrophytes with smaller amounts of cobble, in-water woody debris, overhanging vascular vegetation, organic debris, and other (gravel) cover type (**Table C-4**a). Significant aquatic vegetation was present in P010 with 70% submergent vegetation, 15% emergent vegetation and 5% of the lake surface containing floating vegetation (**Table C-4**a). Emergent and floating vegetation were mapped on the southern side of the lake and cattails were mapped surrounding the northern and eastern sides of the lake with small patches on the west side. Predominant aquatic vegetation species recorded in Pond P010 during AHM surveys are presented in **Appendix G**.

a) Riparian vegetation surrounding pond P010

b) Aquatic vegetation in pond P010

c) Cattails near the northeast end of the pond.

d) Aquatic vegetation along the shoreline

Figure 4-9. Examples of habitat on Pond P010.

4.1.2.2 Named Lakes

No named lakes are present within the AOI. Four named lakes were selected for survey within the GSWC due to the importance of the wetland complex in the region. In addition, Cargill Mill Pond was surveyed as it occurs along the Teeswater River downstream of the AOI and contains pugnose shiner, a *SARA*-listed species. Hines and Robson Lake were also included for survey for their potential as reference lakes to the named lakes within the GSWC. A general description of each of the larger named lakes selected for survey for AHM is described below.

4.1.2.2.1 Silver Lake

Silver Lake (L001) is located within the southwestern portion of the GSWC in the $LSA_{AQU.}$ Silver Lake was selected for AHM surveys as it is important to the community for recreational use and fishing. Silver Lake has a cool water regime and commonly caught species include largemouth bass, northern pike, and sunfish (see Chapter 8). According to the ecosite classification dataset, Silver Lake is primarily surrounded by marsh habitat to the south (see Appendix B, Chapter 1). Examples of habitat in Silver Lake are presented in **Figure 4-10**.

Silver Lake is characterized as a stream fed lake with associated marsh wetland adjacent to the lake with no migratory barriers (**Table C-1**a). Silver Lake is approximately 1.1 km in length and 690 m wide. The inlet

(S052) to Silver Lake, which feeds the lake through a culvert on its west side, is characterized by flats with a mean bankfull width and depth of 6.98 m and 1.63 m respectively. Substrate in the inlet was 100% muck and instream cover primarily consisting of overhanging vascular macrophytes. The outlet (S011) to Silver Lake is a wide channel that exits the lake on its southeast side and is characterized primarily by muck substrate (75%) with detritus (15%) and silt (10%). Instream cover at the outlet is comprised of overhanging and instream vegetation.

Water chemistry in Silver Lake is presented in **Table C-2**. Silver Lake had a water temperature of 23.9 °C, a slightly higher pH (8.6), moderate conductivity (295.0 µS/cm), low turbidity (2.6 NTU), and low dissolved oxygen (6.6 mg/L and 78%). Habitat and features of interest mapped on Silver Lake during AHM surveys are presented on **Figure C-4**. A total of eight zones of differing shoreline habitat were ascribed to Silver Lake during field surveys. Wetland marsh habitat primarily occurred on the southern portion of Silver Lake and was surrounded by deciduous forest beyond the marsh habitat. A small amount of marsh habitat was also located on the northwestern side of Silver Lake. The remaining zones were characterized by having deciduous forest, mixed forest, or grass/lawn surrounding the lake with a small amount of cropland on the eastern side of the lake within the 31-100 m riparian zone (**Table C-3**; Figure D-4 in Chapter 3). Predominant riparian species recorded on the shores of Silver Lake (L001) are presented in **Appendix G**. Silver Lake had primarily vegetated and wetland shoreline types with small amounts of sand/gravel or low/rocky shoreline. Shoreline sediment consisted of a variety of substrate types dominated by muck on the southern side of the lake and a mix of cobble and sand on the northeastern side. Clay, silt, sand, and gravel were found in greatest proportion on the northern section of the lake. A variety of shoreline cover primarily consisting of in-water vascular macrophytes and in-water woody debris were present in Silver Lake (**Table C-4**a). Silver Lake had a significant amount of aquatic vegetation with 55% submergent vegetation present, 10% emergent vegetation present and 5% of the lake surface containing floating vegetation (**Table C-4**a). Floating vegetation was mapped surrounding the eastern side of the lake and in a bay on the west side of the lake. Additionally, a small patch of floating vegetation was mapped in a bay on the northern side of the lake. Predominant aquatic vegetation species recorded in Silver Lake (L001) during AHM surveys is presented in **Appendix G**.

a) Inlet reach (S052) to Silver Lake

b) Inlet reach (S052) culvert

c) Outlet reach (S011) looking at Silver Lake

d) Outlet reach (S011) looking downstream

e) Silver Lake looking north with cabins at far end.

f) Aquatic vegetation on Silver Lake

Figure 4-10. Examples of habitat in Silver Lake.

4.1.2.2.2 Clam Lake

Clam Lake is located adjacent to and east of Silver Lake in the southwestern portion of the GSWC in the LSA_{AQU}. Similar to Silver Lake, Clam Lake was selected for AHM surveys as it is important to the community for recreational use and fishing. Clam Lake has a cool water regime and commonly caught species include northern pike, largemouth and smallmouth bass, and yellow perch (see Chapter 8). According to the ecosite classification dataset, Clam Lake is primarily surrounded by marsh habitat (see Appendix B, Chapter 1) and cottage developments.

While planned for survey, Clam Lake was not surveyed during the 2022 field season due to accessibility logistics. Additional habitat data for Clam Lake will be provided in future iterations of the BIS Baseline Report after field data have been collected by the field data collection contractor and received and analyzed by Zoetica.

4.1.2.2.3 Oppleck Lake

Oppleck Lake (L007) is located near Concession Rd 12 and Sideroad 25N in Bruce County. Oppleck Lake is the local name used for the lake, according to the adjacent landowners. According to the ecosite classification dataset, the lake is surrounded by hardwood swamp on the eastern side and mixedwood forest on the western side. Access to Oppleck Lake is granted from the landowner on the adjacent property.

Oppleck Lake is characterized as an intermittently fed lake with no migratory obstructions (**Table C-1**a). Oppleck Lake is 240 m long and 165 m wide, with a maximum depth of 3.1 m. Oppleck Lake does not have an inlet and the outlet (S120) was dry at the time of survey. Water chemistry in Oppleck Lake is presented in **Table C-2**. Oppleck Lake had a water temperature of 23.2 °C, a normal pH (8.5), moderate conductivity (244.4 µS/cm), low turbidity (1.8 NTU), and low dissolved oxygen (6.1 mg/L and 72%).

Examples of habitat and features in Oppleck Lake are presented in **Figure 4-11**. Habitat and features of interest mapped on Oppleck Lake during AHM surveys are presented on **Figure C-5**. There were two zones of differing shoreline habitat ascribed to Oppleck Lake during field surveys. Mixed forest surrounds most of the lake with a small proportion of grass/lawn on the lake's east side (**Table C-3**; Figure D-4 in Chapter 3). Oppleck Lake had an entirely vegetated shoreline type. Predominant riparian species recorded on the shores of Oppleck Lake (L007) are presented in **Appendix G**. Shoreline sediment consisted of a variety of substrate types dominated by sand with small proportions of cobble and gravel surrounding most of the lake and a combination of muck and silt on the eastern side of the lake. A variety of shoreline cover primarily consisting of in-water vascular macrophytes, in-water woody debris, and overhanging woody debris were present in Oppleck Lake (**Table C-4**a). Two instream logs were mapped by the field data collection contractor: one on the southern side and one on the western side of the lake (**Figure C-5**). Oppleck Lake had a significant amount of aquatic vegetation with 50% submergent vegetation present, and 5% of the lake surface containing floating vegetation (**Table C-4**a). Floating vegetation was mapped in small patches surrounding the lake (**Figure C-5**). A dock and shore stabilization were also mapped on the eastern side of the lake. Predominant aquatic vegetation species recorded in Oppleck Lake (L007) during AHM surveys is presented in **Appendix G**.

a) Oppleck Lake looking west

b) In-water and overhanging woody debris on the shoreline of Oppleck Lake

c) Large log (woody cover) on Oppleck Lake

d) Aquatic vegetation and back stabilization adjacent to lawn area

Figure 4-11. Examples of habitat on Oppleck Lake.

4.1.2.2.4 Schmidt Lake

Schmidt Lake (L003) occurs in the northeastern portion of the GSWC and is a popular destination for public visits. Access to Schmidt Lake is managed by the SVCA. The lake includes a boardwalk and lookout platform with a floating boardwalk that leads to a unique floating bog mat. The lake is surrounded mainly by lowland forest or swamp and is dominated by white cedar. Schmidt Lake flows into Schmidt Creek which has previously been noted by DFO to contain the SAR rainbow mussel. However, an updated version of the webmap does not depict any rainbow (mussel) near Schmidt Lake. Examples of habitat and features in Schmidt Lake are presented in **Figure 4-12**.

Schmidt Lake is characterized as a stream fed lake with associated wetland adjacent to the lake with no migratory obstructions (**Table C-1**a). The inlet (S021) on the east side of the lake and outlet (S001) on the west side were dry at the time of survey. Schmidt Lake is 680 m long and 475 m wide, with a maximum depth of 1.3 m. Water chemistry in Schmidt Lake is presented in **Table C-2**. Schmidt Lake had a water

temperature of 29.4 °C, a high pH (9.5), moderate conductivity (214.3 µS/cm), and low turbidity (2.7 NTU). Dissolved oxygen was not reported in Schmidt Lake.

Habitat and features of interest mapped on Schmidt Lake during AHM surveys are presented on **Figure C-6**. Field crews delineated four zones of differing shoreline habitat on Schmidt Lake. Wetland habitat surrounds Schmidt Lake but occurs in the largest proportion on the northern side where it extends out to the 100 m riparian buffer zone (**Table C-3**; Figure D-4 in Chapter 3). Wetland habitat on the east and west sides of Schmidt Lake extended to the 30 m riparian buffer zone and on the southern side extended only to the 10 m riparian buffer zone. On the east, south, and west sides of Schmidt Lake, wetland habitat was surrounded by primarily mixed forest where wetland habitat did not extend to the 100 m riparian buffer zone. Schmidt Lake had a wetland shoreline type. Predominant riparian species recorded on the shores of Schmidt Lake (L003) are presented in **Appendix G**. Shoreline sediment consisted of silt substrates. Shoreline cover consisted entirely of in-water vascular macrophytes (**Table C-4**a). Schmidt Lake had a significant amount of aquatic vegetation with 95% submergent vegetation present and 5% of the lake surface containing floating vegetation (**Table C-4**a). Cattails were mapped on the west side of the lake (**Figure C-6**). In addition, a dock was mapped on the west side of the lake and a boardwalk was mapped on the north side within wetland habitat (**Figure C-6**). Predominant aquatic vegetation species recorded in Schmidt Lake (L003) during AHM surveys are presented in **Appendix G**.

a) Schmidt Lake looking south

b) Overhanging vegetation on Schmidt Lake

c) Submergent vegetation on Schmidt Lake

d) Wetland habitat on perimeter of Schmidt Lake

Figure 4-12. Examples of habitat on Schmidt Lake.

4.1.2.2.1 Cargill Mill Pond

Cargill Mill Pond (L012) is located along the Teeswater River south of the town of Cargill and downstream of the AOI and LSA_{AQU}. Cargill Mill Pond is a reservoir that was formed by damming the Teeswater River and is included as a lake/pond because it now functions as a lentic environment due to its contained structure. Cargill Mill Pond was included in the biodiversity studies because it: 1) is known to include critical habitat for pugnose shiner, a species listed as Threatened under Schedule 1 of the *SARA*, and 2) is located downstream of the AOI and the LSA_{AQU}, but within the RSA_{AQU} Examples of habitat and features in Cargill Mill Pond are presented in **Figure 4-13**.

Cargill Mill Pond is a stream fed reservoir with associated marsh wetland and a permanent migratory obstruction due to a dam at its northern end (**Table C-1**a). Cargill Mill Pond is 560 m long and 140 m wide, with a maximum depth of 1.7 m. The inlet (S019) to Cargill Mill Pond on the south side is characterized entirely by flats with a sediment mixture of even parts (30% each) cobble, gravel, and sand, and a small proportion (10%) of muck. Most of the inlet (80%) did not have in-stream cover; the remaining 20% primarily consisted of instream vascular macrophytes with a small proportion of in-stream and overhanging woody debris and overhanging vascular macrophytes. A dam at the north end of Cargill Mill Pond divides the reservoir from its outlet (S031). The outlet is characterized as primarily (80%) run habitat with the remaining 20% riffle habitat. Mean bankfull width was 18.6 m in run habitat and 20.4 m in riffle habitat; mean bankfull depth was 1.29 m and 1.13 m in run and riffle habitat, respectively. Sediment at the outlet was comprised primarily of cobble (60%), followed by boulder (30%) and gravel (10%). In-stream cover was primarily cobble (60%) and boulder (20%) with a small proportion (< 5%) instream and overhanging woody debris.

Water chemistry in Cargill Mill Pond is presented in **Table C-2**. Cargill Mill Pond had a water temperature of 20.4 °C, a normal pH (8.2), moderate conductivity (550.0 µS/cm), low turbidity (1.4 NTU), and normal dissolved oxygen (7.5 mg/L and 83%). Habitat and features of interest mapped on Cargill Mill Pond during AHM surveys are presented on **Figure C-7**. A total of three zones of differing shoreline habitat were delineated on Cargill Mill Pond during field surveys. Grass and lawn habitat primarily occurred on the eastern and southern portion of Cargill Mill Pond and deciduous forest occurred within the first 30 m of riparian habitat on the western side. Cropland occurred in the 30 – 100 m riparian zone beyond the deciduous forest habitat on the western side of the reservoir (**Table C-3**; Figure D-4 in Chapter 3). Cargill Mill Pond had a primarily vegetated shoreline type. Predominant riparian species recorded on the shores of Cargill Mill Pond (L012) are presented in **Appendix G**. Shoreline sediment consisted of various substrate types dominated by muck on the western and northeastern sides and by cobble on the south and southeastern side. A variety of shoreline cover primarily consisting of in-water vascular macrophytes was present in Cargill Mill Pond (**Table C-4**a). Other shoreline cover types in lesser proportion were cobble, organic debris, boulders, overhanging vascular macrophytes, in-water woody debris, and overhanging woody debris. Cargill Mill Pond had a significant amount of aquatic vegetation with 70% submergent vegetation, 40% emergent vegetation and 40% of the surface containing floating vegetation (**Table C-4**a). Predominant aquatic vegetation species recorded in Cargill Mill Pond (L012) during AHM surveys are presented in **Appendix G**. Field data collection contractors mapped cattails surrounding the perimeter of the reservoir (**Figure C-7**), and a large area of cattails in the southwest portion adjacent to a shallow depositional area containing emergent vegetation. However, during a previous site visit conducted by Zoetica on 3 June 2022, the large patch of cattails in the southwest portion was not visible. Several boat launches were also situated on the eastern side of the reservoir.

Figure 4-13. Examples of habitat and features on Cargill Mill Pond.

4.1.2.2.2 Robson Lake

Robson Lake (L011) is at 380 masl in Grey County, east of the LSA_{AQU}. Robson Lake has a cool water regime and is a popular fishing lake with commonly caught species including northern pike, smallmouth bass, and pumpkinseed. Robson Lake was selected as a potential reference lake for named lakes within the GSWC as it was most similar to popular fishing lakes within and near the GSWC (e.g., Silver and Clam Lakes) with respect to temperature regime and species composition, based on desk-based analysis of the ARA dataset (see Chapter 8). Examples of habitat and features on Robson Lake are presented in **Figure 4-14**.

Robson Lake is characterized as stream fed with no known migratory obstructions (**Table C-1**a). Robson Lake is 650 m long and 270 m wide. Water chemistry in Robson Lake is presented in **Table C-2**. Robson Lake had a water temperature of 20.8 °C, a normal pH (8.5), moderate conductivity (462.0 µS/cm), low turbidity (1.0 NTU), and normal dissolved oxygen (7.2 mg/L and 80%).

Habitat and features of interest mapped on Robson Lake during AHM surveys are presented on **Figure C-8**. Seven zones of differing shoreline habitat were delineated on Robson Lake during field surveys. Robson Lake is primarily surrounded by mixed forest on its north, east, south, and southwestern shores with coniferous forest on the northwestern shore (**Table C-3**; Figure D-4 in Chapter 3). The western side of the lake had grass/lawn within the 1 – 10 m riparian buffer zone and then mixed forest in the 11 – 100 m riparian zone (**Table C-3**; Figure D-4 in Chapter 3). Predominant riparian species recorded on the shores of Robson Lake (L011) are presented in **Appendix G**. Shoreline was primarily vegetated with some low rocky shore found on the northwest side of the lake and other shoreline types found on the western side. The north and south sides of the lake were surrounded by logs and submerged vegetation. Shoreline sediment consisted of a variety of substrate types dominated by muck on the northwest, east, and southern zones of the lake, sand on the western side of the lake and an even distribution of muck, clay, and silt on the northern and northeastern sides. Robson Lake had a variety of shoreline cover primarily consisting of in-water vascular macrophytes (**Table C-4**a). Other types of shoreline cover in lesser proportion include cobble, organic debris, boulders, in-water woody debris, overhanging woody debris, and a dock. Robson Lake had a significant amount of aquatic vegetation with 60% submergent vegetation present, 5% emergent vegetation present, and 10% of the lake surface containing floating vegetation (**Table C-4**a). Predominant aquatic vegetation species recorded in Robson Lake (L011) during AHM surveys are presented in **Appendix G**. Field data collection contractors mapped a patch of cattails on the eastern side of the lake. Three islands were situated on the eastern side of the lake near the channel connecting Clarke's and Robson lakes (**Figure C-8**). Beach and docks were located on the western side of Robson Lake.

a) Robson Lake looking north with forested riparian habitat

b) Submergent vegetation on Robson Lake

c) Beach and cottages on Robson Lake (west side)

d) Aquatic vegetation on Robson Lake

Figure 4-14. Examples of habitat and features on Robson Lake.

4.1.2.2.3 Hines Lake

Hines Lake (L010) is in Grey County east of the LSA_{AQU} and north of Robson Lake at an elevation of 379 meters. Hines Lake has a cold-water regime and is a popular fishing lake with commonly caught species including northern pike, smallmouth bass, and lake trout. Hines Lake was selected as a potential reference lake for named lakes within the GSWC as it was most similar to popular fishing lakes within and near the GSWC (e.g., Silver and Clam Lakes) with respect to species composition, based on desk-based analysis of the ARA dataset (see Chapter 8). Examples of habitat and features on Hines Lake are presented in **Figure 4-15**.

Hines Lake is a stream fed lake with no recorded migratory obstructions (**Table C-1**a). Hines Lake is 540 m long and 382 m wide. Water chemistry in Hines Lake is presented in **Table C-2**. Hines Lake had a water temperature of 23.2 °C, a slightly high pH (8.7), moderate conductivity (310.0 µS/cm), low turbidity (2.3 NTU), and low dissolved oxygen (6.4 mg/L and 76%).

Habitat and features of interest mapped on Hines Lake during AHM surveys are presented on **Figure C-9**. Field crews delineated six zones of differing shoreline habitat in Hines Lake. Coniferous forest habitat was the dominant shoreline vegetation surrounding the lake except on the northwest and northeast sides of the lake (**Table C-3**; Figure D-4 in Chapter 3). On the northwest side, grass and lawn occurred within the 1-10 m riparian habitat zone and on the northeastern side a small amount of wetland and mixed forest occurred within the 1 – 10 m riparian habitat zone. Coniferous forest was dominant in the 11 – 30 and 31 – 100 m riparian zones except on the northeastern side of the lake where mixed forest and grass/lawn was present within these riparian zones (**Table C-3**; Figure D-4 in Chapter 3). Predominant riparian species recorded on the shores of Hines Lake (L010) are presented in **Appendix G**. The northern section of Hines Lake had no riparian vegetation present. The northeastern, southern, and western sides of Hines Lake had a primarily vegetated shoreline type. The northern side of the lake had a low rocky shore and other types of shore with small amounts of sand/gravel. The eastern side of Hines Lake consisted primarily of sand/gravel shoreline type with some vegetated shore. Shoreline sediment varied, with most areas dominated by sand with cobble dominating in the northern side of the lake. Gravel was also present in larger proportions on the northeastern side of the lake relative to other areas. On the northwestern side of the lake, other substrate types were present. A variety of shoreline cover consisting primarily of in-water vascular macrophytes, overhanging vascular macrophytes, in-water woody debris, and overhanging woody debris were present in Hines Lake (**Table C-4**a). Field data collection contractors mapped two instream logs on the southeast side of the lake and a large patch of woody debris in a bay on the southern side of the lake (**Figure C-9**). Hines Lake had a significant amount of aquatic vegetation with 50% submergent vegetation present, 5% emergent vegetation present, and 5% of the lake surface containing floating vegetation (**Table C-4**a). Predominant aquatic vegetation species recorded in Hines Lake (L010) during AHM surveys are presented in **Appendix G**. Cabins and stabilization were situated on the north and northwest sides of the lake (**Figure C-9**), with additional cabins on the east side.

Figure 4-15. Examples of habitat and features on Hines Lake.

4.1.2.3 Unnamed Lakes and Ponds in the LSA_{AQU}

Seven unnamed waterbodies within the LSA_{AQU} were field surveyed in 2022 including two lakes and five ponds. One additional pond (P003), north of the AOI, was selected for survey but was dry during the time of sampling (see **Figure A-2**). Of the seven unnamed waterbodies surveyed, four were considered intermittent, two were considered not connected, and one had an unknown water source (**Table C-1**b). Three of the waterbodies had no associated wetlands, two had associated swamp habitat, one had marsh habitat, and one had bog habitat (**Table C-1**b). Water chemistry summaries in unnamed lakes and ponds in the LSA_{AQU} are presented in **Table C-2**. Unnamed waterbodies in the LSA_{AQU} had a mean temperature of 21.5 ± 1.1 °C. Most waterbodies had a normal pH (between 6.5 and 8.2), although the minimum recorded pH was 5.2. Conductivity was within normal range (between 200 – 1000 µS/cm), and the minimum recorded conductivity was 160 (just below normal). Turbidity was generally low (below 8 NTU), although the maximum turbidity was 23.1 which is considered moderate to high. Dissolved oxygen was low (below 8 mg/L and 80%) in all unnamed lakes surveyed within the LSA_{AQU}.

Most unnamed lakes in the LSA_{AQU} were surrounded primarily by a vegetated shoreline with three waterbodies partially surrounded by wetland habitat (mean of 40% of wetland) and one lake partially surrounded (5%) by sand/gravel beach (**Table C-4**b). Predominant riparian species recorded on the shores of unnamed lakes in the LSA_{AQU} are presented in **Appendix G**. Most unnamed waterbodies in the LSA_{AQU} contained muck substrate in the greatest proportion (mean of ca. 65%). However, three waterbodies contained relatively large proportions (> 40%) of detritus. Other substrate types found in some of the unnamed waterbodies in the LSA_{AQU} include boulder, cobble, sand, silt, and clay (**Table C-4**b).

All seven waterbodies surveyed had some in-water cover (**Table C-4**b). In-water vascular vegetation and overhanging vascular macrophytes were present at all waterbodies surveyed. Organic debris, in-water woody debris, and overhanging woody debris were present in more than half of the waterbodies surveyed and undercut banks and cobble were present in one waterbody each. In-water vascular macrophytes were present in the greatest proportion relative to other cover types followed by overhanging vascular macrophytes. Aquatic vegetation was present at all waterbodies surveyed (**Table C-4**b). Submergent and emergent vegetation was present at all waterbodies surveyed with submergent vegetation comprising the greatest proportion of aquatic vegetation relative to emergent and floating vegetation. Floating vegetation was present at four of the waterbodies surveyed. Predominant aquatic vegetation species recorded in unnamed lakes in the LSA_{AQU} during AHM surveys are presented in **Appendix G**.

4.1.3 Wetlands

A total of 81 wetlands were planned during 2022 AHM field surveys, however during field surveys, nine reaches originally classified as streams or ponds were reclassified as wetlands due to their characteristics and are summarized within this section. One wetland (W064) selected for survey was reclassified as a watercourse. Eight wetlands selected for survey were not visited including three conifer swamps, Including ponds reclassified as wetlands only 10 wetlands contained water and were surveyed for habitat characteristics with 71 deemed dry at the time of survey (**Table A-1**; **Figure A-3**). Additionally, one wetland originally classified as a marsh was reclassified as a swamp during AHM field surveys. A summary of wetland habitat characteristics is presented in **Appendix D**. Riparian and aquatic vegetation documented during AHM surveys of wetlands is presented in **Appendix G.**

4.1.3.1 Wetlands within the AOI

Field teams surveyed five wetlands within the AOI including three marshes and two swamps. The following sections describe habitat within each type of wetland in the AOI.

4.1.3.1.1 Marsh Wetlands

Two of the marshes were palustrine with intermittent flow and one was isolated. One of the marshes (P013) had a seasonal migratory obstruction (**Table D-1**). Marshes in the AOI had a mean water temperature of 18.2 ± 19.6 °C, moderate pH and conductivity, and low turbidity and dissolved oxygen (**Table D-2**). Substrate in marshes consisted of detritus and silt with one marsh consisting of 40% vegetated bottom (**Table D-3**). In-water cover was primarily vascular macrophytes with organic debris, overhanging vascular macrophytes, and large woody debris comprising a mean of >20% (**Table D-3**). Other in-water cover in smaller proportions include large and small overhanging woody debris, and small in-water woody debris. All types of aquatic vegetation (submergent, emergent, floating) were present in marshes in the AOI (**Table D-3**). Emergent vegetation comprised the largest proportion of aquatic vegetation with submergent and floating vegetation comprising <10% (**Table D-3**).

4.1.3.1.2 Swamp Wetlands

Of the two swamps surveyed within the AOI, one swamp was isolated and the other was palustrine with intermittent flow (**Table D-1**). One swamp (P012) in the AOI had a seasonal migratory obstruction (log jam). Swamps in the AOI had a mean water temperature of 19.4 ± 0.4 °C, moderate pH and conductivity, and low turbidity and dissolved oxygen (**Table D-2**). Substrate in swamps consisted primarily of detritus with a small proportion (< 10%) of silt (**Table D-3**). In-water cover was primarily vascular macrophytes with organic debris, overhanging vascular macrophytes, and overhanging large woody debris comprising a mean of >20% (**Table D-3**). Other in-water cover in smaller proportions included large and small in-water woody debris, and small overhanging woody debris. Emergent vegetation was present in both swamps and submergent and floating vegetation were present in one swamp each (**Table D-3**). Emergent and floating vegetation comprised the largest proportion (mean of 50%) of aquatic vegetation where present with submergent vegetation comprising 10% of aquatic vegetation.

4.1.3.2 Wetlands within the LSA_{AQU}

All wetlands surveyed in the LSA_{AQU} that contained water at the time of survey were swamps. Of the swamps surveyed, two occurred south of the AOI and three occurred north of the AOI.

Swamps surveyed south of the AOI were isolated and did not contain migratory obstructions. Both were surrounded by mature forest and had abundant riparian vegetation providing shade cover (**Table D-1**). Swamps south of the AOI had a mean water temperature of 17.0 ± 0.7 °C, moderate pH and conductivity, and low turbidity and dissolved oxygen (**Table D-2**). Substrate in swamps south of the AOI consisted of detritus (**Table D-3**) with the other half comprised of peat in one swamp (S113; a watercourse reclassified as a swamp) and muck in the other (W053). In-water cover was primarily in-water and overhanging vascular macrophytes (**Table D-3**), with organic debris comprising 100% of in-water cover in one swamp (S113), and small overhanging woody debris comprising 80% in one swamp (S113; a watercourse reclassified as a swamp). Other in-water cover types in smaller proportions included small and large in-water woody debris, and large overhanging woody debris (**Table D-3**). Aquatic vegetation in swamps south of the AOI included large proportions (>90%) of floating vegetation in both swamps and a small proportion of emergent vegetation in one swamp (S113) (**Table D-3**).

Swamps surveyed north of the AOI consisted of a variety of reach types (**Table D-1**). One swamp (W009) was isolated, one (W013) was palustrine with permanent flow, and one (W038) was riverine. Swamps north of the AOI were surrounded by young or mature forest and had abundant riparian vegetation providing shade cover (**Table D-1**). Swamps north of the AOI had a mean water temperature of 22.6 ± 2.5 °C, moderate pH and conductivity, and low turbidity and dissolved oxygen (**Table D-2**). Substrate in swamps north of the AOI consisted of detritus, muck, and silt (**Table D-3**). In-water cover was primarily in-water and overhanging vascular macrophytes and organic debris (**Table D-3**). Other in-water cover types in smaller proportions included small and large in-water and overhanging woody debris. Aquatic vegetation in swamps north of the AOI included floating vegetation in low proportion (<35%) in all swamps, emergent vegetation in small proportion (ca. 20%) in two swamps, and submergent vegetation in relatively larger proportion (40%) in one swamp (**Table D-3**).

4.2 Potentially Important Fish Habitat

During searches of existing datasets, two important fish habitats were identified including critical habitat for pugnose shiner in Cargill Mill Pond (outside and north of the LSA_{AQU}) and a brook trout spawning area in the southern end of the LSA_{AQU}. Ten locations were characterized as potentially important habitat for fish during AHM field surveys in 2022: four within the AOI, and six in the LSA_{AQU} south of the AOI (**Figure E-1**a - c). Of these potentially important habitats, most were seeps or springs with one groundwater interaction. Within the AOI, one spring and/or seep was located on a tributary to the Teeswater River on the western side of the AOI and two seeps were located on a smaller first order tributary to this tributary at the southern end of a wetland. A groundwater source was also located on this first order tributary just north of the seeps. In the LSA_{AQU} south of the AOI, two springs, two seeps, and an inflow and source of a seep were located on Alps Creek.

4.3 Barrier Identification

Barriers are features preventing the movement of fish between connected waterways during all seasons. Obstacles are features that make it more difficult for the passage of fish between connected waterways and may become barriers to fish movement during low flow periods.

4.3.1 Existing Datasets

During desk-based searches of existing aquatic habitat information, 69 potential barriers to fish passage were identified within the BIS aquatic study areas (**Figure F-1**a - c). No barriers were reported within the AOI. In the LSA_{AQU}, nine potential natural barriers were reported: eight beaver dams and one rock barrier. Beaver dams in the LSA_{AQU} were primarily south of the AOI, with one reported in the GSWC south of Cunningham Lake (**Figure F-1**). The potential rock barrier was in the southwest side of the LSA_{AQU} (**Figure F-1**). In the RSA_{AQU}, an additional nine beaver dams, 35 rocks, and four rapids were reported as potential natural barriers (**Figure F-1**). In addition, 12 human-made dams were reported in the RSA_{AQU}. Four human-made dams were located on the Teeswater River upstream of the LSA_{AQU} (**Figure F-1**). The remaining human-made dams were north of the LSA_{AQU} on the Teeswater River (seven) or on the Saugeen River (one) (**Figure F-1**).

4.3.2 AHM Field Surveys

A total of 53 potential barriers or obstacles to fish movement were detected during AHM field studies in 2022 (**Figure F-1**). The sections below describe barriers and obstacles detected within various watercourse, waterbody, and wetland sections within the BIS study areas.

4.3.2.1 Area of Interest

Twenty-five barriers or obstacles to fish movement were reported in the AOI during AHM field studies (**Figure F-1**a). Of the barriers and obstacles recorded, 11 were culverts located on tributaries to the Teeswater River of which six were classified as obstacles (no obvious barrier), one was classified as a seasonal barrier (e.g., did not pass enough water during the summer season) and five were classified as permanent barriers (e.g., they were perched). Beaver dams and log jams were the next most reported obstacles with five beaver dams and one beaver lodge on tributaries to the Teeswater River in the northwest portion of the AOI and four log jams spread across the northern half of the AOI. Other obstacles and barriers in the AOI observed during AHM field surveys included a blockage from overgrowth of vegetation located on a tributary to the Teeswater on the eastern side of the AOI, a human-made crossing

and a road located on the Teeswater River in the northern portion of the AOI, and a dry channel leading to a pond located on the western side of the AOI.

4.3.2.1.1 LSA_{AQU} South of AOI

Field teams reported six barriers or obstacles upstream of the AOI in the southern portion of the LSA_{AQU}, during 2022 AHM surveys (**Figure F-1**b). One beaver dam was on Alps Creek and four beaver lodges were on a small lake north of the Wingham Wetland Complex, which may be the same as those reported in existing datasets (see Section 4.3.1). In addition, one culvert was also located in a wetland in the Wingham Wetland Complex and was classified as a potential seasonal barrier.

4.3.2.1.2 LSA_{AQU} North of the AOI

Field teams reported 14 barriers or obstacles downstream of the AOI in the northern portion of the LSA_{AQU} (**Figure F-1**c). Two culverts classified as obstacles (no obvious barrier) and three beaver dams were located on Schmidt Creek. An additional beaver dam, a log jam, and a dry channel were located on a wetland (W013) connected with Schmidt Creek. Three beaver dams and a beaver lodge were located on Kinlough Creek in the GSWC and one blockage from overgrowth was on the outlet of Silver Lake.

4.3.2.1.3 In RSA_{AQU} Downstream of AOI

In the RSA_{AQU} at the northern end of Cargill Mill Pond, one barrier, a human-made dam, and one beaver dam, were reported during AHM field surveys (**Figure F-1**c). The human-made dam was previously reported in existing datasets (see Section 4.3.1). No other barriers or obstacles to fish passage were recorded during AHM field surveys downstream of the AOI.

4.3.2.1.4 Additional Barriers

Field teams reported six barriers or obstacles in watercourses and waterbodies outside of the BIS study areas on Robson and Hines Lakes (**Figure F-1**). One human-made weir was at the outlet of Robson Lake, four docks were on Robson Lake, and one culvert classified as a potential seasonal barrier was near the inlet to Hines Lake.

5.0 DISCUSSION

This Appendix D of the 2023 BIS Baseline Report focused on desk-based analyses of aquatic habitat and results from the first year of Tier 1 field data collection. Complete results from Tier 1 AHM field surveys will be included in future iterations of the BIS Baseline Report once field data have been received and analyzed by Zoetica.

5.1 Presence and Distribution of Aquatic Habitat within the BIS Study Areas

Aquatic habitat data collected in the BIS aquatic study areas will allow Zoetica to: (1) characterize watercourse and waterbody habitat characteristics to meet the requirements laid out in the TISG Template, and (2) select potential control sites within or outside the greater RSA_{AQU} if no suitable control sites exist within the LSA_{AQU}. The TISG Template requires fish habitat data and descriptions of habitat by mesohabitat (pool, riffle, run), including channel measurements, substrate characterization, and aquatic and riparian vegetation surveys (IAAC 2022). In addition, the TISG Template requires the identification of natural obstacles (e.g., falls, beaver dams) or existing structures (e.g., water crossings) that may hinder the free passage of fish (IAAC 2022). AHM data collection in 2022 provides a first step in characterizing aquatic habitats within the AOI, LSA_{AQU}, and select areas of the RSA_{AQU}.

The AOI was characterized primarily by low discharge streams and tributaries that meander through wetlands, deciduous forests, and agricultural lands. Streams were mainly run habitat with some riffle habitat primarily on tributaries to the Teeswater. Riffle habitat is often used for spawning by many species, and plays a key role in food production as these areas tend to be abundant in insects and other invertebrates (Kobayashi et al. 2013). Substrates in surveyed reaches changed from more cobble-dominated substrates in the southern portion of the AOI to more silt-dominated substrates in the northern reaches of the Teeswater in the AOI. Muck[5] substrates were most prevalent in tributaries to the Teeswater that run through wetlands. In-water cover was more prevalent in watercourse reaches in the northern portion of the AOI that ran through wetland and forest habitat relative to the central and southern portions of the AOI which were more dominated by agricultural lands.

Very few waterbodies were present in the AOI, except for a few small ponds and lakes (< 5 ha). The two waterbodies surveyed in the AOI had primarily vegetated shores adjacent to wetland habitat, primarily muck substrates with smaller amounts of cobble, gravel, silt and sand, shoreline cover consisting primarily of in-water and overhanging vascular vegetation, and significant (>30%) amounts of submergent vegetation. These substrates and cover types are consistent with lakes and ponds found in wetland areas. Several ponds were reclassified as marsh or swamp wetlands at the time of survey and contained little water. Most of the other wetlands surveyed within the AOI were dry at the time of survey except for one additional marsh in the northern portion of the AOI. Wetlands in the AOI were primarily comprised of detritus and silt sediments with in-water and overhanging vascular macrophytes and woody debris comprising most in-water cover. Emergent vegetation was most predominant in wetland habitats within the AOI, which is common for wetlands.

Within the LSA_{AQU}, habitat south of the AOI was most similar to the AOI and consisted of tributaries that primarily flowed into the AOI as well as small waterbodies and wetlands. Habitat in surveyed tributaries flowing into the Teeswater River in the AOI was similar to tributaries within the AOI, consisting primarily of riffle and run habitat with a few reaches containing pools. Pools are often found downstream of riffle habitat and offer deeper slower moving areas that act as refuge areas for fish (Hodges and Magoulick 2011) and may also be important overwintering areas for smaller fish such as minnows (Brown et al. 2011).

Substrate and cover within the LSA_{AQU} south of the AOI were similar to the southern portion of the AOI. In the LSA_{AQU} north of the AOI, reaches surveyed on the Teeswater River and major tributaries to the Teeswater (e.g., Kinlough and Schmidt Creeks) were primarily flats with muck substrates and in-water cover comprised of vascular vegetation and woody debris. These reaches were indicative of streams that run primarily through wetland habitat.

Field teams surveyed several larger waterbodies within the LSA_{AQU} north of the AOI, including Silver, Oppleck, and Schmidt Lakes. These lakes are upstream of the Teeswater River where water intake and output are anticipated to occur, and so should not be impacted by downstream effects from the Project. However, the lakes were included to ensure that effects of the Project are contained within the immediate downstream area from the AOI. At the time of survey, Clam Lake was not accessible, and Cunningham Lake was deemed to be inaccessible and unsafe to survey as it is surrounded by a floating bog. Each surveyed lake was unique in habitat characteristics. Schmidt Lake is completely contained within the

[5] See AHM SOP in the BPD Report (Zoetica 2022) for definitions of substrate types.

GSWC, and surrounded by wetland and deciduous forest, thus was the least impacted by adjacent land use. Schmidt Lake is publicly accessed by trails, boardwalk, and a dock for nature viewing purposes. Silver Lake is a popular lake for fishing and is surrounded by cottages, forest, and meadow/agricultural land. Oppleck Lake is on privately owned property and surrounded by forest and a cottage on a grassy property.

Lakes outside of the LSA_{AQU} were surveyed for several purposes. Cargill Mill Pond was surveyed as it was deemed Critical Habitat within the federal recovery strategy for pugnose shiner (DFO 2012) and occurs downstream of the site. Habitat within Cargill Mill Pond was characteristic of a stream-fed lake adjacent to wetland habitat but is unique as it is a human-made dammed lake. BIS surveys in Cargill Mill Pond are primarily to assure stakeholders and rights-holders that no effects of the Project reach Cargill Mill Pond and that any effects would be localized and not carried far downstream (e.g., not exceed 20 km or the LSA_{AQU}). Robson and Hines Lakes were surveyed outside of the RSA_{AQU} as potential reference lakes for Silver and Clam Lakes. Robson and Hines Lakes were similar in habitat, water quality and anthropogenic characteristics to Silver and Clam Lakes and have similar fish species present (see Chapter 8).

5.2 Habitat Potentially used by Fish and other Aquatic and Semi-aquatic BVs for Various Life History Phases

Fish require a diversity of habitats to carry out various life history phases and for protection from predators. The TISG Template requires characterization of fish habitat features that may demonstrate the presence of fish species, including water quality and quantity, sediment types, prey, shelter, refuge, feeding, spawning habitats, nursery habitats, rearing habitats, overwintering, migration routes and sensitive times for these activities (IAAC 2022). Data collected through AHM field studies can aid in identifying suitable habitat for fish species of interest and establishing areas for further studies to identify potential spawning, rearing, overwintering, and migratory habitats (see Chapter 8). Aquatic habitat data are also relevant for determining suitable habitat for other aquatic and semi-aquatic BVs such as semi-aquatic mammals, birds (e.g., marsh bird breeding habitat), amphibians, and reptiles (e.g., nesting and overwintering habitat for turtles) and to meet the TISG Template requirements for riparian and wetland environments outlined in Chapter 3.

Water quality and quantity studies were conducted as part of the Environmental Media Baseline Program (EMBP) (CanNorth 2020) and at the time of writing the 2023 BIS Baseline Report, these data were not available to Zoetica. However, general water chemistry parameters were collected during BIS AHM studies. In general, watercourses in all BIS aquatic study areas had neutral pH (with slightly elevated (> 8.2) pH in the Teeswater River upstream of the AOI and Alps Creek), low turbidity (except for reaches in the Teeswater in the AOI and downstream of the AOI with moderate turbidity) and moderate conductivity. Dissolved oxygen was low (< 6.5 mg/L and <80%) in many of the reaches surveyed within the Teeswater River and its tributaries. Dissolved oxygen was within the normal healthy range for fish habitat (between 6.5 – 8 mg/L and 80 – 120%) (H2OU 2019) in the Teeswater within the AOI and Alps Creek. Similarly, waterbodies within the AOI and LSA_{AQU} were within normal range for most water quality characteristics and have the potential to support fish populations. However, dissolved O_2 was generally low in surveyed lakes. Full dissolved O_2 profiles were conducted in lakes as part of the EMBP limnology program. Results of full limnological and bathymetric surveys conducted as part of the EMBP, once available, will help to further determine the potential for fish habitat within these lakes.

Considerations of prey, feeding preferences, and sensitive times are typically species-specific for fish and are discussed in Chapter 8. The AHM studies were designed to identify potentially important habitats for

fish species of various ecotypes (e.g., benthic, benthopelagic, pelagic) and trophic classes (e.g., herbivore, planktivore, detritivore, insectivore, invertivore, carnivore) to carry out various life history phases. Data on habitat characteristics may also inform potentially important habitats for other aquatic and semi-aquatic wildlife species to carry out various life history phases. For example, several Significant Wildlife Habitats, including turtle nesting and wintering areas, amphibian breeding habitats, and marsh bird breeding habitats, require various aquatic habitat features to support species (see Appendix C, Chapter 1).

Within the AOI, field teams identified several groundwater sources and seeps, which are considered potentially important fish habitats. Typically, groundwater-surface water interactions can be important areas for fish spawning and rearing for certain species such as brook trout (Curry and Neakes 2011). Field teams identified groundwater seeps and springs in several reaches along Alps Creek in the LSA_{AQU} south of the AOI. No seeps or groundwater areas were reported within the LSA_{AQU} north of the AOI. The first year of AHM studies identified only limited habitat that may be important for fish. However, this data will be combined with additional years of Tier 1 data, bathymetric and limnological data from the EMBP (CanNorth 2020), and Tier 2 data after site selection to characterize fish communities. Together, these data will help identify potentially important areas for fish within the BIS aquatic study areas.

5.3 Barriers to Fish Passage

To date, desk-based and field-based assessments focused on identifying potential barriers to fish passage in aquatic habitats. A total of 122 barriers or obstacles to fish passage, most of them beaver dams, were reported within the BIS study areas. However, some barriers may be represented in both the desk-based and field surveyed areas, and so 122 may be an overestimate. Twenty-five barriers or obstacles to fish passage were reported in the AOI during AHM field surveys, most of which were culverts followed by beaver dams. Culverts can pose barriers to fish passage if they are perched and can be obstacles if they do not pass sufficient water. Beaver dams can pose barriers to fish passage if they do not allow enough flow through the structure and may pose obstacles if they have enough flow. In addition, beaver dams are sometimes abandoned by beavers and rebuilt elsewhere within the watercourse potentially creating multiple obstacles and barriers to fish passage within a given section of the watercourse. A human-made road crossing was located on the Teeswater River in the northern section of the AOI, which could pose an obstacle or barrier to fish passage during lower flow periods.

5.4 Identification of Suitable Sampling Sites for Tier 2 Studies

Information collected as part of Tier 1 studies will help to direct future Tier 2 studies aimed at characterizing community composition of various aquatic and semi-aquatic BVs that use these aquatic habitats. AHM data collected during Tier 1 studies will ultimately help determine suitable sampling sites for Tier 2 biodiversity studies. Some data collected during AHM studies to date (e.g., reaches with riffle and pool habitat, seeps and groundwater, and good cover) can help select Tier 2 sampling locations for fish community characterization and studies on other aquatic and semi-aquatic species. However, additional relevant data is required to determine where future Tier 2 fish studies will be undertaken. Such data include water quality, sediment quality, limnology, bathymetry, and primary and secondary producers from the EMBP (CanNorth 2020), results of other BIS Tier 1 studies such as eDNA metabarcoding (see Appendix E, Chapter 1), future years of AHM habitat data, and potential infrastructure siting. Sites for Tier 2 fish characterization studies will include all watercourse and waterbody reaches potentially impacted by the Project, as well as locations within the AOI and LSA_{AQU} that are potentially

important for fish spawning, rearing, overwintering, and migration life history phases. Additional control sites will be included for Tier 2 studies outside of potentially affected areas (within the LSA_{AQU} and RSA_{AQU}). In addition, sites that are currently impacted by other anthropogenic activities may also be investigated for their use as eventual offsetting locations if required.

5.5 Limitations and Next Steps

Field surveys in the SON-South Bruce siting area were limited to watercourses, waterbodies and wetlands that were accessible on public lands, NWMO-owned/optioned lands, and private lands where owners had granted permission to survey. As a result, many reaches within the AOI and the LSA_{AQU} south of the AOI could not be surveyed as they were on private lands where permission was not granted. Future efforts to collect AHM information on watercourses, waterbodies, and wetlands within the AOI and LSA_{AQU} south of the AOI are anticipated for the 2024 field season. However, additional aquatic habitat surveys within these areas will require the NWMO to attain agreements for additional property access.

In addition to access, the summer of 2022 was an exceptionally dry season in the SON-South Bruce region. Approximately 12% of wetlands surveyed during summer 2022 contained water. As a result, summaries of AHM data in wetlands by wetland type (i.e., marsh, swamp, fen, bog) are limited, and more field work within these habitat types will be required to adequately characterize wetland habitat within the study areas. It is anticipated that a spring wetland reconnaissance survey will be conducted in the spring of 2024 to characterize the extent of flooding within the AOI and LSA_{AQU}. Wetlands may be revisited during the summer season to provide additional insight as to whether the wetlands were dry because 2022 was an abnormally dry year, or because the wetlands naturally dry during the summer season. After site selection, if the SON-South Bruce site is selected, more in-depth wetland surveys (OWES surveys) will be planned in wetlands anticipated to be impacted by the Project. In addition to wetlands, some of the surveyed first order streams and other small watercourses connecting ponds and lakes selected for survey in 2022 were also dry during the summer of 2022 when they were surveyed. The BIS design in 2022 primarily surveyed second order or greater watercourses, except for inlet and outlet streams, and first order tributaries with known presence of SAR. While primary order streams were not the focus of 2022 field surveys, they may be surveyed in accessible areas in 2024 to understand whether they hold water throughout the year or are intermittent in nature. In future years, after a site is selected and once more is known about infrastructure placement, a survey of all reaches potentially affected by the Project, including first order streams, will be required, and potential reference sites will be selected based on considerations of habitat similarity.

The Project is still in early stages of baseline data collection. Tier 1 studies were aimed at characterizing basic habitat information to determine the suitability of various aquatic habitats for species of interest and provide insight on where more detailed studies (i.e., Tier 2 and 3 studies) should be focussed. More detailed information will be required to inform a future IA should the SON-South Bruce siting area be selected. However, these early AHM data can help inform infrastructure siting by identifying areas to avoid that contain unique or potentially important habitat.

APPENDIX A – SUMMARY OF PLANNED AND SURVEYED REACHES IN THE BIS STUDY AREAS

Table A-1. Summary of planned and surveyed reaches within the BIS aquatic study areas.

	Study Area	Number of Reaches Selected for Survey	Number of Reaches Surveyed in 2022	Number of Dry Reaches Visited in 2022	Total Reaches Visited in 2022
Watercourses					
Second order or higher watercourses	AOI	46	41	2	43
First order watercourses with SAR	AOI	3	1	2	3
Caslick Drain	LSA_{AQU}	1	1	0	1
Alps Creek	LSA_{AQU}	18	9	0	9
Teeswater River downstream of AOI	LSA_{AQU}	13	11	0	11
Kinlough Creek	LSA_{AQU}	3	2	0	2
Schmidt Creek	LSA_{AQU}	4	3	0	3
Teeswater River upstream of AOI and upstream of City of Teeswater	RSA_{AQU}	3	0	0	0
Teeswater River upstream of AOI and downstream of City of Teeswater	RSA_{AQU}	2	2	0	2
Teeswater River downstream of LSA_{AQU}	RSA_{AQU}	4	0	0	0
Inlets and Outlets for Waterbody Surveys	All	31	7	11	18
Reclassified Stream[1]	AOI	0	1 (conifer swamp to stream)	0	1
	LSA_{AQU} (south)	0	2 (marsh to stream)	0	2
Total Watercourses		**128**	**80**	**15**	**95**
Waterbodies					
Clam Lake	LSA_{AQU}	1	0	0	0
Silver Lake	LSA_{AQU}	1	1	0	1
Oppleck Lake	LSA_{AQU}	1	1	0	1
Hodgins Lake	LSA_{AQU}	1	0	0	0
McFarlane Lake	LSA_{AQU}	1	0	0	0
Schmidt Lake	LSA_{AQU}	1	1	0	1

Hines Lake	Outside	1	1	0	1
Robson Lake	Outside	1	1	0	1
Cargill Mill Pond[3]	RSA_{AQU}	1	1	0	1
Unnamed Lakes/Pond	AOI	8	2	0	2
Unnamed Lakes/Ponds	LSA_{AQU}	13	8	0	8
Total Lakes/Ponds		**30**	**16**	**0**	**16**
Wetlands					
Hardwood Swamps	AOI	9	0	9	9
	LSA_{AQU} (south)	8	1	7	8
	LSA_{AQU} (north)	12	2	9	11
Mixedwood Swamps	AOI	5	0	5	5
	LSA_{AQU} (south)	5	0	3	3
	LSA_{AQU} (north)	7	0	7	7
Conifer Swamps	AOI	4	0	3	3
	LSA_{AQU} (south)	2	0	1	1
	LSA_{AQU} (north)	2	0	1	1
Shrub Swamps	AOI	2	0	2	2
	LSA_{AQU} (south)	2	0	2	2
	LSA_{AQU} (north)	2	0	2	2
Reclassified Wetland[1]	AOI	0	2 (ponds to swamps) 2 (ponds to marsh)	1 (pond to dry site)	5
	LSA_{AQU} (south)	0	1 (stream to swamp)	3 (ponds to dry site)	4
	LSA_{AQU} (north)	0	1 (marsh to swamp)	0	1
Marshes	AOI	10	3	9	10
	LSA_{AQU} (south)	9	0	6	6
	LSA_{AQU} (north)	2	0	1	1
Total Wetlands		**81**	**12**	**71**	**81**
Total Survey Locations		**239**	**108**	**86**	**192**

Note: [1]Assessed as watercourse, waterbody, or different type of wetland as per Zoetica.

Table A-2. Site IDs of surveyed watercourses, waterbodies, and wetlands within the AOI, LSA_{AQU}, RSA_{AQU}, and reference areas outside the BIS study areas.

Grouping	Sites Included
Watercourses	
AOI	
Tributaries to Teeswater (21 sites)	S006, S008 - S009, S014, S029, S032, S034, S050, S053, S093 - S096, S099 - S103, S105, S108, W139
Teeswater River (22 sites)	S004, S007, S013, S015 - S016, S035, S038 - S040, S042, S051, S056, S067 - S068, S070 - S077
LSA_{AQU}	
Teeswater River Upstream of AOI (2 sites)	S049, S078
Teeswater River Downstream of AOI (11 sites)	S002, S003, S010, S046, S058, S059, S061, S062, S063, S064, S065
Caslick Municipal Drain (1 site)	S126
Alps Creek (9 sites)	S018, S033, S045, S047, S079, S080, S081, S089, S090
Kinlough Creek (4 sites)	S011, S026, S030, S052
Schmidt Creek (3 sites)	S037, S044, S057
RSA_{AQU} & Outside	
Inlets and Outlets to Reference Lakes (4 sites)	S124, S125, S019, S031
Waterbodies	
AOI	
Unnamed Waterbodies	L006, P010
LSA_{AQU}	
Named Lakes	Silver Lake (L001), Schmidt Lake (L003), Oppleck Lake (L007)
Unnamed Waterbodies	L004, L005, P005, P007, P008, P009, P015
RSA_{AQU} & Outside	
Named Lakes	Cargill Mill Pond (L012), Hines Lake (L010), Robson Lake (L011)
Wetlands	
AOI	
Marshes (3 sites)	P002, P013, W132
Swamps (2 sites)	P012, P016
LSA_{AQU}	
Swamps north of AOI (3 sites)	W009, W013, W038
Swamps south of AOI (2 sites)	S113, W053

Notes:
[1]Site IDs included in each data analysis category are provided in **Table A-2**.
[2]In the Teeswater River upstream category, one site is technically in the RSA_{AQU} but borders closely with the LSA_{AQU} and is geographically proximal to the other site in this category, so it has been included in the LSA_{AQU} for data summarization.

Notes:
[1]Site IDs included in each data analysis category are provided in **Table A-2**.
[2]In the Teeswater River upstream category, one site is technically in the RSA_{AQU} but borders closely with the LSA_{AQU} and is geographically proximal to the other site in this category, so it has been included in the LSA_{AQU} for data summarization.

APPENDIX H – SPECIES LIST

Table H-1. Common and scientific names for species mentioned in this report. Species names follow the NHIC's Ontario species lists (current to March 1, 2023).

Common Name	Scientific Name
Fish	
Brook trout	*Salvelinus fontinalis*
Lake trout	*Salvelinus namaycush*
Largemouth bass	*Micropterus salmoides*
Northern pike	*Esox lucius*
Pugnose shiner	*Notropis anogenus*
Pumpkinseed	*Lepomis gibbosus*
Smallmouth bass	*Micropterus dolomieu*
Sunfish	*Lepomis* sp.
Yellow perch	*Perca flavescens*
Invertebrates	
Rainbow mussel	*Villosa iris*
Mammals	
Beaver	*Castor canadensis*
Vegetation	
American / White Elm	*Ulmus americana*
American Cranberry	*Viburnum trilobum*
Arrowhead	*Sagittaria* sp.
Ash sp.	*Fraxinus sp.*
Basswood	*Tilia americana*
Beak-rush	*Rhynchospora sp.*
Bittersweet Nightshade	*Solanum dulcamara*
Black Spruce	*Picea mariana*
Bladderwort	*Utricularia sp.*
Blue flag	*Iris versicolor*
Blueberry	*Vaccinium* sp.
Bog Laurel	*Kalmia polifolia*
Broadleaf Arrowhead	*Sagittaria latifolia*
Broadleaf Cattail	*Typha latifolia*
Bull Thistle	*Cirsium vulgare*
Bur-reed	*Sparganium sp.*
Buttonbush	*Cephalanthus occidentalis*
Calico Aster	*Symphyotrichum lateriflorum*
Canada Thistle	*Cirsium arvense*
Cattail sp.	*Typha* sp.
Cherry sp.	*Prunus* sp.
Chokecherry	*Prunus virginiana*
Christmas Fern	*Polystichum acrostichoides*

Common Name	**Scientific Name**
Clasping-leaf pondweed	*Potamogeton richardsonii*
Common /European Buckthorn	*Rhamnus cathartica*
Common Boneset	*Eupatorium perfoliatum*
Common Jewelweed	*Impatiens capensis*
Common Milkweed	*Asclepias syriaca*
Common ninebark	*Physocarpus opulifolius*
Common pondweed	*Potamogeton natans*
Common Speedwell	*Veronica officinalis*
Coontail	*Ceratophyllum sp.*
Curly leaf pondweed	*Potamogeton crispus*
Cutgrass	*Leersia sp.*
Cutgrass	*Leersia oryzoides*
Devil Beggartick	*Bidens frondosa*
Duckweed	Lemna sp.
Eastern bur-reed	*Sparganium americanum*
Eastern Hemlock	*Tsuga canadensis*
Eastern White Cedar	*Thuja occidentalis*
Eastern White Pine	*Pinus strobus*
Elderberry	*Sambucus sp.*
Fanwort	*Cabomba caroliniana*
Fine leaved pondweed	*Stuckenia filiformis*
Flat Leaved Pondweed	*Potamogeton compressus*
Flatstem pondweed	*Potamogeton zosteriformis*
Floating bur-reed	*Sparganium fluctuans*
Giant bur-reed	*Sparganium eurycarpum*
Goldenrod sp.	*Solidago* sp.
Green Ash	*Fraxinus pennsylvanica*
Green Bulrush	*Scirpus atrovirens*
Heath Aster	*Symphyotrichum ericoides*
Hemp Dogbane	*Apocynum cannabinum*
Hop Sedge	*Carex lupulina*
Horned Pondweed	*Zannichellia palustris*
Horsetail	*Equisetum sp.*
Invasive Common Reed	*Phragmites australis* ssp. *australis*
Joe Pye	*Eutrochium sp.*
Joe-Pye-weed	*Eutrochium fistulosum*
Labrador tea	*Rhododendron* sp.
Lance-leaved Self-heal	*Prunella vulgaris*
Largeleaf pondweed	*Potamogeton amplifolius*
Leatherleaf	*Chamaedaphne calyculata*
Manitoba Maple	*Acer negundo*

Common Name	**Scientific Name**
Maple sp.	*Acer* sp.
Mare's-tail	*Hippurus vulgaris*
Marsh speedwell	*Veronica scutellata*
Meadow-rue	*Thalictrum* sp.
Mild Waterpepper	*Persicaria hydropiperoides*
Naiad	*Najas sp.*
Narrow bur-reed	*Sparganium angustifolium*
Narrowleaf Cattail	*Typha angustifolia*
Narrowleaf meadowsweet	*Spiraea alba*
New England Aster	*Symphyotrichum novae-angliae*
Nodding Beggarticks	*Bidens cernua*
Northern pondweed	*Potamogeton alpinus*
Norway Maple	*Acer platanoides*
Ostrich Fern	*Matteucia struthiopteris*
Pale Smartweed	P*ersicaria lapathifolia*
Pickerelweed	P*ontederia cordata*
Pondweed sp.	*Potamageton* sp.
Poplar sp.	*Populus* sp.
Raspberry	*Rubus* sp.
Red Maple	*Acer rubrum*
Red Oak	*Quercus rubra*
Red-osier Dogwood	*Cornus sericea*
Reed Canarygrass	*Phalaris arundinacea*
Ribbonleaf pondweed	*Potamogeton epihydrus*
Rice Cutgrass	*Leersia oryzoides*
Riverbank Grape	*Vitis riparia*
Royal Fern	*Osmunda regalis*
Rush sp.	*Juncus* sp.
Sago pondweed	*Potamogeton pectinatus*
Scot's Pine	*Pinus sylvestris*
Sedge sp.	*Carex* sp.
Sensitive Fern	*Onoclea sensibilis*
Serviceberry sp.	*Amelanchier* sp.
Silver Maple	*Acer saccharinum*
Smartweed	*Polygonum* sp.
Smooth Rose	*Rosa blanda*
Softstem Bulrush	*Schoenoplectus tabernaemontani*
Torrey's bulrush	*Schoenoplectus torreyi*
Spatterdock	*Nuphar sp.*
Speedwell	*Veronica* sp.
Sphagnum moss	*Sphagnum* sp.

Common Name	**Scientific Name**
Creeping spikerush	*Eleocharis palustris*
Spikerush	*Eleocharis sp.*
Spotted Joe Pye-weed	*Eutrochium maculatum*
Stinging Nettle	*Urtica dioica*
Stonewort	*Charales sp.*
Sugar Maple	*Acer saccharum*
Swamp Loosestrife	*Decodon verticillatus*
Swamp Milkweed	*Asclepias incarnata*
Sweet flag	*Acorus* sp.
Sweetgale	*Myrica gale*
Tall Meadowsweet	*Spiraea sp.*
Tamarack	*Larix laricina*
Tape-grass	*Vallisneria americana*
Three-way sedge	*Dulichium arundinaceum*
Water arum	*Calla palustris*
Water Horehound	*Lycopus americanus*
Water marigold	*Megalodonta beckii*
Water Parsnip	*Sium suave*
Water smartweed	P*olygonum amphibium*
Water Speedwell	*Veronica anagallis-aquatica*
Watercress	*Nasturtium* sp.
Water-lily	*Nymphaea sp.*
Water-milfoil	*Myriophyllum sp.*
Water-plantain	*Alisma plantago-aquatica*
Watershield	*Brasenia schreberi*
Waterweed	*Elodea sp.*
White beak-rush	R*hynchospora alba*
White Birch	*Betula papyrifera*
White Snakeroot	*Ageratina altissima*
White Spruce	*Picea glauca*
Willow sp.	*Salix* sp.
Wood Nettle	*Laportea canadensis*
Woolgrass	*Scirpus cyperinus*

Report (R001)

BIODIVERSITY IMPACT STUDIES – SOUTHWESTERN ONTARIO REGION: ENVIRONMENTAL DNA 2023 BASELINE REPORT

December 13, 2023

List of Tables

List of Appendix Figures

List of Appendix Tables

GLOSSARY AND ABBREVIATIONS

AOI	Area of Interest
Barcode	A short, variable DNA region, flanked by conserved DNA regions for primer design, useful for differentiating taxa
Barcode gap	In eDNA metabarcoding, a gene region amplified by a primer that has less within-species variation than between-species variation is said to have a barcode gap. Barcode gaps can also be assessed at higher taxonomic levels, such as genus or family. There is increased confidence in a detection of taxa with a barcode gap than taxa without a barcode gap.
Biodiversity value	The biotic environmental components that will be considered for study within the Project's Biodiversity Impact Studies. A subset of biodiversity values will ultimately be scoped into the Biodiversity Impact Assessment as Valued Components.
BIS	Biodiversity Impact Studies
BLAST	Basic Local Assignment Search Tool; a program that compares nucleotide or protein sequences to sequence databases and calculates statistics on the results
BPD	Biodiversity Impact Studies – Southwestern Ontario Region: Baseline Program Design
BPPA	Biodiversity Impact Studies – Southwestern Ontario Region: Best Practices and Preferred Approach
COSEWIC	Committee on the Status of Endangered Wildlife in Canada
DNA	Deoxyribonucleic Acid
eDNA	Environmental DNA; extra-organismal genetic material that has been expelled into the environment, such as skin, feces, gametes, hair, and other cells.
GRTS	Generalized Random Tessellation Stratified
Habitat grouping	The type of watercourse, waterbody, or wetland to be sampled. There are eight habitat groupings proposed for initial eDNA studies: 1. Watercourses: a. rivers/streams 2. Waterbodies: a. lakes/ponds ≤ 1 ha, b. lakes/ponds > 1 ha 3. Wetlands: a. marshes, b. conifer swamps, c. mixedwood swamps, d. hardwood swamps, e. shrub swamps Habitat groupings were determined through desk-based analysis of remotely sensed habitat data; however, these classifications should be verified by the field contractor on the ground. Wetland habitat groupings also include land access considerations at the time of writing (September 2023). If access to other aquatic habitat areas is provided at a later date, sampling that habitat type may occur in a subsequent field campaign.

IUCN	International Union for the Conservation of Nature
LSA	Local Study Area LSA_{AQU} = Aquatic Local Study Area
NWMO	Nuclear Waste Management Organization
Rights-holders	First Nation and Métis communities who have asserted and or hold recognized treaty and/or Indigenous rights and whose Traditional Territories include the Project location.
RSA	Regional Study Area RSA_{AQU} = Aquatic Regional Study Area
SAR	Species at Risk
SARA	Federal *Species at Risk Act*
SARO	Species at Risk in Ontario
SON	Saugeen Ojibway Nation
SON-South Bruce siting area	Used to describe the broader area surrounding the defined area within which the Project may be located. The SON-South Bruce siting area is the general area surrounding the Municipality of South Bruce and includes the traditional territory of Saugeen Ojibway Nation (SON) in southwestern Ontario.
SOP	Standard Operating Procedure
The Project	The Adaptive Phased Management Project is the Deep Geological Repository and other required infrastructure for the safe, long-term management of Canada's used nuclear fuel.
TISG	Tailored Impact Statement Guidelines

1.0 BACKGROUND

Environmental DNA (eDNA) refers to extra-organismal genetic material that has been expelled into the environment, such as skin, feces, gametes, hair, and other cells (Stewart 2019). Instead of collecting samples directly from the organism, eDNA can be collected from the surrounding environment, such as water or soil, to assess habitat occupancy. eDNA detections can indicate that a species has been recently present in the general area (though see Section 5.1 for further discussion of limitations). Compared to traditional surveys, eDNA methods are non-invasive, highly sensitive and accurate for many species, generally more cost-effective for taxa that are otherwise difficult to detect, have a low risk of pathogen transfer between sites, and typically do not require permits. Furthermore, eDNA metabarcoding uses high-throughput sequencing to enable the rapid detection of multiple species at the same time, and both samples and data can be archived for retroactive analysis in the future[1].

Despite some limitations (see Section 5.1.3 of Zoetica™'s *Best Practices and Preferred Approach (BPPA) Report* for more details (Zoetica 2021)), eDNA metabarcoding is an exciting and promising new tool for biodiversity baseline data collection and monitoring studies. This technique is a powerful first-pass methodology to detect species (e.g., cryptic species that would require more effort for an initial detection using traditional methods), which can help design Tier 2 studies to focus on collecting key data on abundance and relative abundance values for focal species.

1.1 Objectives

The primary data objectives of the aquatic eDNA metabarcoding studies for the Biodiversity Impact Studies (BIS) at the Saugeen Ojibway Nation (SON)- South Bruce siting area are to:

1. Provide community-level species composition data that can indicate areas that may host more or fewer species and that contribute relatively more or less to the overall genetic diversity of the Area of Interest (AOI) and aquatic local study area (LSA_{AQU});
2. Locate cryptic species that are difficult to detect using traditional methods, some of which may be species-at-risk and/or important to stakeholders and rights-holders; and
3. Characterize the presence and distribution of biodiversity values within the AOI and LSA_{AQU} under current conditions that may inform subsequent, targeted studies to measure population abundance and relative abundance.

Appendix E, Chapter 1 of the 2023 SON-South Bruce BIS Baseline Report begins to fulfil the requirements of the Tailored Impact Statement Guidelines (TISG) Template[2] (see Appendix C in Zoetica's BPPA Report (Zoetica 2021)).

Collecting community-level species composition data (Objective 1) at baseline will serve several purposes. Understanding overall biodiversity in the area, including species of interest (e.g., at-risk, rare, culturally important), will help inform early site selection of the Project, mitigation, and design, and will help inform further baseline studies. Community-level biodiversity baseline data will also help make predictions about the effects of the Project and can help determine if the Project had an effect (during post-construction monitoring) on the presence and distribution of a species and/or genetic diversity. For example, these

[1] In all sections of this 2023 BIS Baseline Report, where eDNA studies and results are noted, they refer to the use of eDNA in combination with metabarcoding for multi-species identification.
[2] Please see Chapter 1 for the limitations of and planned updates to the TISG Template (IAAC 2023).

baseline data could show that a species was likely not present to begin with or that a range shift (natural or perhaps climate change-induced) has occurred.

1.2 Best Practices

Since eDNA survey methods are relatively new and continually being optimized (especially eDNA collection with metabarcoding laboratory analysis), there are currently no formally accepted standard methods. However, cohesive Canadian and international guidelines are emerging for designing, conducting, analyzing, reporting, and interpreting eDNA studies, including metabarcoding (Goldberg et al. 2016, Hobbs et al. 2017, Helbing and Hobbs 2019, The eDNA Society 2019, Abbott et al. 2021). Recent research studies have also included good practice recommendations and proposed standard protocols for field sampling (e.g., water collection, eDNA capture), laboratory methods (e.g., eDNA extraction, genetic marker selection), and bioinformatic data processing for eDNA metabarcoding (Deiner et al. 2017, Dickie et al. 2018, Zinger et al. 2019, Morey et al. 2020, Mychek-Londer et al. 2020, Shu et al. 2020).

Best practices are discussed in further detail in Section 2.4 of Zoetica's *Baseline Program Design Report* (BPD) (Zoetica 2022a) and Section 5.1.3 of the BPPA Report (Zoetica 2021).

2.0 STUDY AREAS

In 2022, aquatic eDNA metabarcoding studies were focused within the AOI and the LSA_{AQU}, and within select areas outside of the LSA_{AQU} (see Section 3.0, Chapter 1 for study area delineations). Outside of the LSA_{AQU}, sites within and outside of the RSA_{AQU} were included to capture appropriate control sites and areas known to support critical habitats for Species at Risk (SAR)[3]. Within the AOI, the goal of the eDNA metabarcoding study is to survey all waterbodies, watercourses, and wetlands that the Project may directly impact. However, as the final Project location has not yet been determined, the sampling design during the first field campaign consisted of reduced effort distributed over the entire AOI. Additional surveying can be undertaken once more information about the Project is known (including location, components, activities, and the extent of potential impacts) and based on results from the initial eDNA metabarcoding studies. Data objectives for eDNA collection within the AOI are primarily driven by the potential Project footprint and associated infrastructure that could directly impact these habitats and the biodiversity values that depend on them to fulfill their life history requisites, such as fish, herpetofauna, and SAR. Data objectives within the LSA_{AQU} are primarily driven by potential Project interactions and localized cumulative effects on aquatic and semi-aquatic biodiversity values (e.g., effects on surface water quality and hydrology, resulting in direct and indirect habitat loss, mortality, and impacts to movement).

[3] For the purposes of the 2023 Baseline Report, conservation statuses described in text for at-risk species refer to their Species at Risk in Ontario (SARO) listings unless otherwise indicated. Conservation statuses are from the NHIC's Ontario species list, current to March 1, 2023, and updated for any discrepancies with provincial and federal SAR listings up to August 15, 2023. As such, species and status listings may differ from those presented in Zoetica's 2021 BPPA Report (Zoetica 2021).

3.0 METHODS

3.1 Survey Locations

For initial eDNA metabarcoding studies, Zoetica first categorized aquatic habitat types into the following habitat groupings that are thought to likely host different species assemblages:

- Watercourses: streams and rivers
- Waterbodies: lakes and ponds ≤1 ha; lakes and ponds >1 ha
- Wetlands: marshes, conifer swamps, mixedwood swamps, hardwood swamps, and shrub swamps

Wetland sample sites were identified using Generalized Random Tessellation Stratified (GRTS) design (the GRTS study design is further described in Section 4.3.1 in the BPPA Report (Zoetica 2021)). For further details regarding sample allocation, habitat groupings, and sampling implementation, see Zoetica's *Standard Operating Procedure* (SOP) *for Aquatic eDNA Field Sampling* (Aquatic eDNA SOP) (Zoetica 2022b) and Section 2.4 of the BPD Report (Zoetica 2022a). See also Appendix A, Chapter 1 for data quality scoring.

Logistical difficulties, including expected sampling areas being devoid of water and limited permission to access private land, prevented sampling at some of the planned survey locations. The actual sampling allocation by site and season is skewed towards watercourses (**Table 3-1**). In one or more seasons, field crews sampled a total of 41 sites in the AOI, 50 sites in the LSA_{AQU}, and six sites outside of the LSA_{AQU}, within and outside of the RSA_{AQU}. Field crews visited but were unable to sample 71 sites. Overall, the results from 609 samples were verified and included in eDNA summaries.

Table 3-1. eDNA metabarcoding sampling locations by site type, study area, and season. Letter in the parentheses indicates the standard prefix identifying the habitat grouping in eDNA metabarcoding results.

Habitat Grouping	AOI	Outside the AOI
Summer		
Watercourses (S)	29	18
Waterbodies (all)	1	6
Lake (> 1 ha; L)	0	2
Pond (≤ 1 ha; P)	1	4
Wetlands (all)	8	7
Marsh	3	1
Swamp	5	6
Total	38	31
Fall		
Watercourses (S)	30	29
Waterbodies (all)	2	14
Lake (> 1 ha; L)	1	9
Pond (≤ 1 ha; P)	1	5
Wetlands (all)	3	11
Marsh	2	3
Swamp	1	8
Total	35	54

3.2 Field Sampling

3.2.1 Survey Timing and Environmental Conditions

Initial eDNA metabarcoding field campaigns for the BIS baseline program were conducted in the summer and fall of 2022. Environmental factors can affect eDNA persistence and degradation; as such, field crews recorded environmental conditions at each sampling location to enable appropriate data interpretation and transparent reporting (see Section 6.5.2 in the Aquatic eDNA SOP (Zoetica 2022b)). These factors may be evaluated in statistical models after at least three years of data collection.

Field surveys in the SON-South Bruce siting area were limited to watercourses, waterbodies and wetlands that were accessible on public lands, Nuclear Waste Management Organization (NWMO)-owned/optioned lands, and private lands where owners had granted permission to survey. As a result, many reaches within the AOI and the LSA_{AQU} south of the AOI could not be surveyed as they were on private lands where permission was not granted. In addition to access, the summer of 2022 was an exceptionally dry season in the SON-South Bruce region, and many sites visited for eDNA sampling did not contain enough water to sample. As a result of accessibility and dry conditions, field crews were unable to sample over 78% of wetlands that they attempted to access for eDNA sampling (**Table J-1**).

3.2.2 Survey Crew

Field teams from North/South Consultants completed the 2022 eDNA field sampling campaigns, with support from the Saugeen Valley Conservation Authority. A field technician from Dr. Robert Hanner's research laboratory at the University of Guelph trained field staff in aquatic eDNA sample collection, filtration, storage, and transport. Zoetica provided instruction on GRTS sampling and contingency planning. Contracted field staff consisted of skilled wildlife and fisheries field personnel who could identify suitable microhabitats for sampling. Field staff were also familiar with wetland classification according to the Ontario Wetland Evaluation System (MNRF 2014) and could accurately identify wetland types on the ground.

3.2.3 eDNA Sample Collection and Data Recording

Field staff collected and recorded eDNA data following the Aquatic eDNA SOP developed by Zoetica (Zoetica 2022b) following *in situ* training provided by the Hanner Laboratory (University of Guelph). Field staff recorded data on a digital field form created by NWMO contractors based on paper forms included within the BPD Report (Zoetica 2022a). Field contractors provided environmental condition data outputs to Zoetica following field contractor quality plans. Field data, once quality checked by the field data collection contractor, were provided to Zoetica for data analysis and interpretation. Data reviewed by Zoetica were assumed to be cleaned following a quality assurance / quality control procedure undertaken by the field data collection contractor and error-free.

3.3 Laboratory Analyses

Metabarcoding refers to the amplification of a DNA molecular region common to many species that allows for simultaneous identification of many taxa from a single sample via a high-throughput sequencing platform (Cristescu 2014, Deiner et al. 2017). Prior to eDNA metabarcoding laboratory analysis, Zoetica provided a preliminary list of species of interest to the Hanner Laboratory for a barcode gap analysis (Appendix A). This list included species from both siting areas under consideration for the Project (see

Section 1.0, Chapter 1). A barcode gap analysis examines the regions amplified by the three primers used in laboratory analysis to determine if the species in question can be differentiated by the primer in question (Meyer and Paulay 2005). Detection of a species with a barcode gap is therefore more reliable than detection of a species without a barcode gap or a species for which a barcode gap has not been assessed.

Members of Dr. Hanner's laboratory at the University of Guelph performed DNA extraction, amplification, and sequencing. The lab processed samples for three molecular markers, COI-Vert, COI-Invert, and 12S-MiFish. Using these three primers allows for a broader range of possible detections across the animal kingdom and more reliable detections. The laboratory also filtered and trimmed the sequencing results, checked for errors, and merged results based on protocols developed by the Hanner laboratory. A Basic Local Assignment Search Tool (BLAST) search on the final sequences produced 250 BLAST results that were then used to assess a final taxonomic assignment for each sample sequence. To increase confidence in results, the laboratory reduced eDNA metabarcoding results to identifications with a minimum of 95% identity and 95% coverage[4]. The laboratory reported identifications to the genus or species level, which Zoetica used in most of the following summaries. eDNA taxa identification data, once quality checked by the Hanner Laboratory, were provided to Zoetica for data analysis and interpretation. Data reviewed by Zoetica were assumed to be cleaned following a quality assurance / quality control procedure undertaken by the Hanner Laboratory and error-free.

Zoetica received eDNA metabarcoding results from the Hanner Laboratory as numbers of sequence reads for each taxa detected in samples collected at each site. The number of sequence reads does not indicate the presence of multiple individuals of a species; therefore the sample results were combined and the resulting number of sequence reads was reduced to a binary result, with "1" indicating that the taxa was detected at the given site during the stated season, and "0" indicating that the taxa was not detected at the given site during the stated season. A "0" indicates that the species was not detected at the site; however, it does not mean that the species is necessarily absent. These binary detection/non-detection data were used to create the tables included in Appendices C-G.

Zoetica compared the eDNA metabarcoding species detections to a list of species of conservation concern for Ontario maintained by the Natural Heritage Information Centre, which includes information on species at risk in Ontario (SARO) and species listed under the federal *Species at Risk Act* (*SARA*) among other sources (see Appendix D and Section 3.1 in the BPPA Report (Zoetica 2021) for a comprehensive list of SAR, including at-risk species, and the methods used to compile this list). Zoetica also compared the eDNA metabarcoding species detections to a list of invasive and potentially invasive species, which includes species regulated under the Ontario *Invasive Species Act*, species listed as pests by the Canadian Food Inspection Agency, and other sources. Zoetica compared eDNA metabarcoding results to a curated list of species and taxa at higher levels of identification that may be or are of interest to rights-holders and stakeholders, as well as species of potential socio-economic importance. Due to the large number of invertebrate detections, identifications to the species level were used to create a refined list of all detected invertebrate families.

[4] Percent identity is the percentage of the DNA bases in the sample that are identical to the reference genome (the sample in the database), relative to the alignment length (Fassler and Cooper 2011). Percent coverage is the percentage of the sample length that aligns with the database record relative to the alignment length (NIH n.d.).

Zoetica's evaluation of vertebrate species detections included geographic screening to determine if the detected species' known or expected range included the SON-South Bruce siting area. Species identified as out-of-range were submitted to the Hanner lab for further investigation, including analysis for a barcode gap.

A list of the vertebrate species detected with eDNA metabarcoding, including scientific and common names, is included in Appendix C for mammals, Appendix D for amphibians, Appendix E for birds, and Appendix F for fish. Scientific names for invertebrate species are listed in Appendix G. As common names of invertebrates are not included in the tables in Appendix G, the scientific name of invertebrate species is included following usage of its common name in Sections 4.2.5 and 4.2.6. For any other vertebrate species mentioned in the text that was not detected with eDNA metabarcoding as part of the current study, the scientific name follows the first mention of its common name.

3.4 Statistical Analyses

Of the 609 samples included in data summaries, 548 included measurements of at least one site environmental covariate. Field crews reported several reasons why environmental data may not have been collected at a site, including water too shallow for the water quality meter, malfunctions of devices such as the turbidity meter, and duckweed too thick for accurate measurements. For the first year of data collection, Zoetica calculated the minimum, mean, standard deviation, and maximum values for parameters related to the sample collection, such as air and water temperature, water pH, and turbidity (**Table J-2**). Statistical analyses on the eDNA metabarcoding results, including measures of occupancy and regression regarding covariates associated with detections, can occur after a minimum of three years of data collection and will be reported in future iterations of the BIS Baseline Report. R code is available upon request.

4.0 RESULTS

eDNA metabarcoding indicated the presence of 1009 taxa, including 642 unique species identifications and 294 identifications to genus. Of the 294 taxa detected to the genus level, 139 genera did not correspond to an identification at the species level (Appendix B). The remaining 73 detections were only to the family level. Lists of species[5] detected by study area, habitat grouping, and season are included in taxa-specific appendices: mammals in Appendix C, amphibians in Appendix D, birds in Appendix E, fish in Appendix F, and invertebrates in Appendix G.

4.1 Species Composition and Richness Patterns

Due to small and unevenly distributed sample sizes (e.g., more stream samples than all other habitat groupings, higher availability of accessible sites in the fall), overall counts of taxa detected in different habitat groupings and seasons may not be reliably compared (**Table 3-1**). Generally speaking, eDNA metabarcoding identified more species in the fall than the summer and more species in watercourses compared to other habitat groupings (**Table 4-1**). However, no amphibian species were detected in watercourses in the summer. Although more samples were collected in the fall compared to the summer, the higher number of species detections in the fall applies to habitat types where sampling effort was similar between the seasons – samples from wetlands collected in the summer resulted in fewer overall species detections (15 sites, 96 species) compared to wetland samples collected in the fall (14 sites, 197 species). A table of counts of species detected with eDNA metabarcoding by taxa group, site, and season is included in Appendix K.

Table 4-1. Number of unique species detected with eDNA metabarcoding by taxa type, season, and habitat grouping. Counts include all detections to species, before geographic curation and further investigations by the Hanner Lab.

Habitat Grouping	Total Species	Amphibian Species	Bird Species	Fish Species	Mammal Species	Invertebrate Species
Summer						
Watercourses	306	0	14	24	8	260
Waterbodies (all)	72	2	4	12	3	51
Lakes	33	1	1	11	2	18
Ponds	53	1	3	6	3	40
Wetlands (all)	96	2	6	10	5	73
Marshes	52	2	5	10	4	31
Swamps	67	1	4	4	3	55
Fall						
Watercourses	427	3	15	26	12	371
Waterbodies (all)	164	1	4	25	7	127
Lakes	120	1	4	25	7	83
Ponds	75	1	2	5	3	64

[5] While all eDNA species detections are reported in this chapter, detections are only reported within the BV-specific study areas in Chapters 1–9.

Habitat Grouping	Total Species	Amphibian Species	Bird Species	Fish Species	Mammal Species	Invertebrate Species
Wetlands (all)	197	1	9	7	8	172
Marshes	112	1	1	5	5	100
Swamps	122	1	9	5	7	100

4.1.1 Overall Detections – Summer

To begin to understand the distribution of species across sampling locations within the AOI and outside of the AOI, Zoetica looked at numbers of detected species of different taxa across sampled sites. First, Zoetica compared species numbers detected in summer sampling. For mammals, in the summer a watercourse site in the eastern AOI had the largest number of species (five; **Figure C-1**). Zoetica detected four unique mammal species at three other watercourse sites in the AOI, along a line roughly northeast-southwest. Outside of the AOI, the site with the most mammal species detections (four) was a watercourse site to the north of the AOI. Of the six sites with detections of amphibian species, three were inside the AOI: one marsh site in the northwestern AOI where two species were detected (**Figure D-1**), one swamp in the northeastern AOI with one species detection, and one marsh site in the central AOI with one species detection. A lake site in the northeastern portion of the LSA_{AQU} and two pond sites south of the AOI each had one amphibian species detection.

For birds, in the summer a watercourse site north of the AOI had the largest number of species (four; **Figure E-1**). Zoetica detected three unique bird species at two other sites in the AOI, one at a watercourse site in the east-central portion of the AOI and the other in a swamp in the south-central area of the AOI. A watercourse site in the west-central AOI had the largest number of unique fish species (10; **Figure F-1**). Four other watercourse sites in the AOI along a line roughly south-southwest to north-northeast each had eDNA metabarcoding detections of nine unique fish species. Two sites in the northern LSA_{AQU} also had detections of nine fish species. Zoetica detected the highest number of unique invertebrate species (56) at a watercourse site in the east central AOI (**Figure G-1**). Of the eleven sites with the most invertebrate species detections (38-56), ten were watercourse sites in the north and central portions of the AOI, along a line roughly west-southwest to east-northeast. Outside the AOI, the site with the largest number of unique invertebrate species (39) was a watercourse site along the northeastern LSA_{AQU}.

4.1.2 Overall Detections – Fall

In the fall, the two sites with the most detections of mammal species (six each) were a watercourse site in the east-central section of the AOI and a watercourse in the northeastern LSA_{AQU} (**Figure C-2**). Five other sites – one in the eastern AOI, three in the LSA_{AQU} north of the AOI, and one south of the AOI in the LSA_{AQU} – each had five mammal species detections in the fall. Four sites in the AOI and 13 sites in the LSA_{AQU} each had one amphibian detection in the fall (**Figure D-2**). The four AOI sites with amphibian detections in the fall were in the western, northeastern, and central portions of the AOI. For bird species, a watercourse site in the west central AOI had the most detections of unique species in the fall (five; **Figure E-2**). Zoetica detected four unique bird species in the fall at two other sites in the central and east sections of the AOI. A watercourse site northeast of the LSA_{AQU}, outside of the RSA_{AQU}, had the most detections of unique fish species (13; **Figure F-2**). Inside the AOI, four sites in the north-central and west-central AOI each had nine unique fish species detections in the fall. Zoetica recorded the largest number of unique invertebrate taxa (58 species) at a watercourse site north of the AOI in the northeastern LSA_{AQU} (**Figure G-2**). In the AOI, the

site with the largest number of unique invertebrate taxa (52 species) was in the northeast quadrant of the AOI.

4.1.3 Combined Detections – Both Seasons

In the summer, a site in the west-central AOI recorded the largest number of unique vertebrate species (15; **Figure H-1**), contrasting with the site with the most invertebrate species detections (56), which was in the northeastern quadrant of the AOI (**Figure G-1**). The site with the second-most vertebrate species detections (14) was in the eastern AOI. Six sites, including three in the northeastern LSA_{AQU} and three in the AOI, recorded 13 vertebrate species in the summer.

In the fall, a watercourse site northeast of the LSA_{AQU}, outside of the RSA_{AQU}, had the most vertebrate species detections (18; **Figure H-2**). Four sites in the LSA_{AQU} north of the AOI had detections of 16 or 17 unique vertebrate species. In the AOI, the sites with the most unique vertebrate species detections (15) were watercourses in the northwestern AOI. A watercourse site in the northeastern LSA_{AQU} had the most invertebrate species detections in the fall (58; **Figure G-2**).

4.1.4 Species of Conservation Concern

eDNA metabarcoding technology indicated the presence of two vertebrate and three invertebrate species of conservation concern (**Table 4-2**). Approximate locations[6] of detections of species of conservation concern are depicted in **Figure I-1**. Digger crayfish and juniper seed moth (both provincially rare) were each detected in more than one grid square, while wood thrush, monarch, and pugnose shiner (all SAR) were detected in one grid square each (**Figure I-1**).

eDNA metabarcoding indicated the presence of three SAR: wood thrush, pugnose shiner, and monarch. In the summer, eDNA metabarcoding indicated the presence of monarch in one grid square in the LSA_{AQU} (**Figure I-1**). In the fall, wood thrush was detected in one grid square in the AOI and pugnose shiner was detected in one grid square in the LSA_{AQU} (**Figure I-1**). The Committee on the Status of Endangered Wildlife In Canada (COSEWIC) has designated both wood thrush and pugnose shiner as Threatened (COSEWIC 2012, 2013) and monarch as Endangered (COSEWIC 2016). The Species at Risk in Ontario (SARO) database lists wood thrush and monarch as species of Special Concern (COSSARO 2013a, 2020) and pugnose shiner as Threatened (COSSARO 2013b). Wood thrush has a NatureServe conservation status of S4B in Ontario, indicating that the breeding population is apparently secure, but possible causes for concern exist (NatureServe n.d.). A NatureServe conservation rank of S2 indicates that the pugnose shiner is at high risk of extirpation in Ontario (NatureServe n.d.). A NatureServe conservation status of S2N, S4B indicates that the non-breeding monarch population in Ontario is imperiled or at high risk of extirpation, while the breeding population is apparently secure, but causes for concern exist (NatureServe n.d.).

In the fall, eDNA metabarcoding indicated the presence of two provincially rare invertebrate species, juniper seed month and digger crayfish (**Figure I-1**). Juniper seed moth was detected in two grid squares in the AOI, and digger crayfish was detected in three grid squares – one in the AOI and two in the LSA_{AQU} (**Figure I-1**). Juniper seed moth and digger crayfish are not SARA- or SARO-listed species, but in Ontario both species have a NatureServe conservation status of S3, indicating that each species is vulnerable and at moderate risk of extirpation (NatureServe n.d.).

[6] Due to the sensitivity of at-risk and rare species, exact locations of detections are not shown on maps nor included in the Appendices.

Table 4-2. Summary of species of conservation concern detected using eDNA metabarcoding sampling in 2022.

Common Name	Scientific Name	NatureServe Conservation Rank in Ontario	COSEWIC Designation	SARO Classification	Season of Detection	Habitat Grouping
Pugnose Shiner	*Notropis anogenus*	S2	Threatened	Threatened	Fall	Lake
Monarch	*Danaus plexippus*	S2N, S4B	Endangered	Special Concern	Summer	Stream
Wood Thrush	*Hylocichla mustelina*	S4B	Threatened	Special Concern	Fall	Stream
Juniper Seed Moth	*Argyresthia alternatella*	S3	N/A	N/A	Fall	Stream
Digger Crayfish	*Fallicambarus fodiens*	S3	N/A	N/A	Fall	Stream Swamp

The Hanner Lab performed additional investigations into the detections of S2 species: monarch and pugnose shiner (**Table 4-3**). Additional analysis indicated that there is a barcode gap for pugnose shiner, but there is overlap between pugnose shiner and another native fish in the same genus, the sand shiner (*Notropis stramineus*). Therefore, this detection should be followed-up by field investigations to verify the presence of pugnose shiner. For monarch, the evidence is mixed, indicating that the data available may not be sufficient to determine if a barcode gap exists. In addition, there is a species in the same genus, the soldier or tropical queen (*Danaus eresimus*) that overlaps with the monarch. However, the typical range of the soldier includes the Caribbean, Central America, and the southern United States, although a verified observation of soldier occurred in Ontario in 2002 (Lotts and Naberhaus 2021). As a result, this detection may be monarch rather than the soldier, but uncertainty exists. Due to the inconclusive results, further field investigations should occur to verify this detection.

Table 4-3. Results of further analysis by the Hanner Lab for selected species at risk detected in 2022.

Common Name	Species	Class	Primer	Summary
Pugnose Shiner	*Notropis anogenus*	Actinopteri	Vert	There are three record matches for two occurrences, with an average of just over 100 reads per occurrence. The initial results had 100% coverage and 99.5% identity. The results of the Hanner Lab barcode gap analysis indicated that there does appear to be a barcode gap for the species, but the species *Notropis stramineus* does overlap. As such, this identification may be either species, and given the small available *Notropis* dataset, this would most reliably be placed at a genus level identification.
Monarch	*Danaus plexippus*	Insecta	Invert	With 30 record matches, a single ASV and only a single occurrence, with only 54 reads, this result does not have strong support. The Hanner lab conducted a DNA barcode gap assessment and detected a gap. However, this gap has a poorly supported bootstrap value and the taxa does overlap with *Danaus eresimus*. As such, this identification may be either species, and given the small available *Danaus* dataset, this would most reliably be placed at a genus level identification.

4.1.5 Species of Interest to Stakeholders and Rights-holders, and species of Potential Socio-Economic Importance

During engagement activities in 2020, groups of taxa were mentioned as being of importance, such as migratory birds, herpetofauna, and fish communities (see Appendix B of the BPPA for more information; Zoetica 2021). Stakeholders and rights-holders also identified invasive species as being of interest; these are discussed in Section 4.1.6. At this time, specific taxa of interest to stakeholders, rights-holders, and taxa of potential socio-economic importance have not been identified for the SON-South Bruce siting area. Specific species of interest may be identified from ongoing and future engagement activities and will be discussed in future iterations of the BIS Baseline Report.

4.1.6 Invasive and Potentially Invasive Species

eDNA metabarcoding suggests the presence of one potentially invasive vertebrate species and five invertebrate invasive species (**Table 4-4**). eDNA metabarcoding results detected pig across all site types and both seasons. Detection of pig DNA may indicate the presence of domestic pigs or invasive wild pigs, also known as feral hogs; therefore, Zoetica refers to these detections as a potentially invasive species. All invertebrate species indicated as potentially invasive were checked against the Global Invasive Species Database, maintained by the Invasive Species Specialist Group of the International Union for the Conservation of Nature (IUCN, http://www.iucngisd.org/gisd/). Locations of detections of invertebrate invasive species are depicted in **Figure I-2**. Inside the AOI, summer invertebrate invasive species detections included rusty crayfish, red earthworm, and spongy moth (also known as LDD moth), and fall detections included rusty crayfish, common earthworm, and red earthworm (**Figure I-2**). Red earthworm, an invasive earthworm commonly used as bait, was the most frequently detected invasive or potentially invasive invertebrate species (11 sites). Red earthworm was detected in two streams in the AOI in both the summer and fall seasons and at seven sites in the LSA_{AQU} – one stream site in the summer and five streams and a pond in the fall (**Figure I-2**). The spongy moth, a destructive pest of hardwood trees (Global Invasive Species Database 2022), was detected at a watercourse sampling site in the east-central portion of the AOI (site S096, **Figure I-2**). The Hanner lab found evidence of a barcode gap for rusty crayfish for at least one primer used in this study (**Table A-1**). Based on the available data, there is no barcode gap for octagonal tail-worm, red earthworm, or spongy moth (**Table A-2**).

Table 4-4. 2022 detections of invasive and potentially invasive species.

Common Name	Scientific Name	Number of Sites with Detections	Summer Detection Locations (count)	Fall Detection Locations (count)
Octagonal tail-worm	*Dendrobaena octaedra*	2	--	LSA_{AQU} (2): Swamp (2)
Rusty Crayfish	*Faxonius rusticus*	4	AOI (1): Stream (1) LSA_{AQU} (2): Stream (2)	AOI (1): Stream (1)

Notes: See Appendix A for information regarding barcode gap analyses.				

4.2 Presence and Distribution of Biodiversity Values

As only one summer and one fall season of data have been collected, data cannot be used to determine species absence from a site. However, even if absence cannot be confirmed, eDNA metabarcoding detections indicate presence. Presence and distribution can be more fully assessed after at least three years of eDNA sampling. General, overall richness patterns for broad taxa groups are included in Section 4.1.

4.2.1 Geographic Curation

Zoetica reviewed the known ranges of vertebrates detected to species with eDNA metabarcoding and found 12 species not expected to occur in Ontario (**Table 4-5**). Of the out-of-range taxa, there were five birds, four fish, one amphibian, and two mammals. Several of the exotic species detected but not known to exist in Ontario belong to the same genera as native species, and so could indicate presence of the native species instead. For example, the detected wedge-tailed eagle is in the same genus as golden eagle (*Aquila chrysaetos*), a native bird species, so may indicate the presence of golden eagle instead. The detected Gulf coast waterdog is in the same genus as the native species common mudpuppy (*Necturus maculosus*), so may indicate the presence of common mudpuppy instead.

The Hanner Lab investigated the out-of-range taxa for identification data available in public databases, the quality of those data, the quality of the eDNA metabarcoding result, considered the geographic range of the identified species and known relatives, and performed barcode gap analyses, if possible. The Hanner lab thus recommended removing five taxa from the results due to insufficient data and / or borderline results. The Hanner Lab also determined that the remaining seven out-of-range species should only be identified to the genus level due to limitations as outlined in **Table 4-5**.

Table 4-5. eDNA metabarcoding detections of vertebrate species determined to be out of their known range, and results of further analysis by the Hanner Lab.

Common Name	Species	Class	Range	Notes	RESULT
Tricolored Blackbird	*Agelaius tricolor*	Aves	Pacific Coast, Baja peninsula (Mexico) to Oregon (U.S.)	Not enough data to support this identification. With only a single molecular match and a sequence coverage just above our 95% threshold, combined with the geographic curation, this taxonomic assignment is not reliable. As such, this taxonomic assignment should be moved up to genus and would then most likely represent a red winged blackbird (*Agelaius phoeniceus*).	Genus–- Not enough data, borderline results
Wedge-tailed Eagle	*Aquila audax*	Aves	Australia	Each match for this taxa matched to only a single record from the MetaWorks database, which is most likely an incorrectly named record. This taxonomic assignment can be moved up to genus and then would most likely represent an endemic bird such as the Golden Eagle (*Aquila chrysaetos).*	Genus–- not enough data
Barnacle Goose	*Branta leucopsis*	Aves	North Atlantic, Greenland and eastward	With very little genetic variation between the taxa of this genus (< 1 %) and with few records for three of the four taxa with available data, this result should be rolled back to genus. In addition, the *B. leucopsis* results have a lower identity nearer the 95% threshold. This result may represent an endemic species, Canada goose (*Branta canadensis*) or cackling goose (*Branta hutchinsii*).	Genus–- no barcode, borderline results
Golden Jackal	*Canis aureus*	Mammalia	SE Europe—SE Asia	While the barcode gap did show a gap for this species (and several others in the *Canis* genus), the quality of these analyses is poor. For example, the *Canis aureus* identification is based on only three records, each of which has the same haplotype (single unique sequence). Also, *C. adustus* had no barcode gap with *C. aureus* noted as one of the overlapping records. There is also known hybridization within the genus. Thus, records with taxa outside of the expected range should be set to the genus *Canis*. This result may represent endemic species such as coyote (*Canis latrans*) or domestic dog (*Canis lupus familiaris*).	Genus–- species overlap and known hybridization
Forbes's Blackbird	*Curaeus forbesi*	Aves	South America, non-migratory	Not enough data to support this identification. Each of the 3 sequence matches for these taxa were based on a single match. Furthermore, the sequence coverage was just above the 95% threshold indicating that there were	Remove—not enough data, borderline results

Common Name	Species	Class	Range	Notes	RESULT
				more than 10 different nucleotides. As such, this taxonomic assignment should be removed from the analysis.	
Glassy Darter	*Etheostoma vitreum*	Actinopterygii	Southern U.S.	While many of the species in this genus do have a barcode gap for the amplified region, this Darter did not have a barcode gap. It overlaps with other records in the genus and as such the taxonomy should be moved up to genus. Therefore, any of the *Etheostoma* fish could be represented by this result. Endemic species that could be indicated by this result include rainbow darter (*Etheostoma caeruleum*), greenside darter (*Etheostoma blennioides*), or least darter (*Etheostoma microperca*).	Genus–- no barcode
Lined Chub	*Hybopsis lineapunctata*	Actinopterygii	Southeastern U.S.	There is only a single record match and a single unique sequence recovered, it has a relatively low sequence identity (with just over 95%). Furthermore, there are very few reads reported with only two reads in a single sample. This result is suspect and should be removed.	Remove–- borderline results
Tepui Vireo	*Hylophilus sclateri*	Aves	South America	While this taxon does have a barcode gap when compared to three other taxa in the genus (where data are available), the bootstrap resampling support for this gap is weak. There are few data representing the taxa, and each of the BLAST results also had weak support (both identity and coverage near the 95% threshold). This, in combination with the geographic curation, indicates that this taxonomic assignment should be removed from the data set.	Remove–- not enough data, borderline results
Blacktail Redhorse	*Moxostoma poecilurum*	Actinopterygii	Southern U.S.	Although this species did display a barcode with the available sequence data, there are many closely related and overlapping taxa in this genus. The BLAST results were on the lower end of the 95% threshold cutoff. Thus, along with the taxonomic curation, it is likely that this record represents a sister species in the genus. As such this record should be moved up to genus. This detection may represent several endemic species such as river redhorse (*Moxostoma carinatum*) or silver redhorse (*Moxostoma anisurum*).	Genus–- species overlap, borderline results
Gulf Coast Waterdog	*Necturus beyeri*	Amphibia	Southeastern U.S.	This taxonomic assignment was based on 12S molecular data. After alignment and cleaning, there were no records available to assess the barcode gap for this taxon for the MiFish amplified region.	Remove–- not enough data

Common Name	Species	Class	Range	Notes	RESULT
				Furthermore, with only a single match and an out-of-range taxonomic curation, this taxonomic assignment can be removed.	
Mule Deer	*Odocoileus hemionus*	Mammalia	Western North America	With 10 records, a single occurrence, and 18 reads in the sample, this is a weak positive. With the available data there is no DNA barcode gap for the region amplified. This record could only be reliably called the genus *Odocoileus.* This detection may represent the endemic species white-tailed deer (*Odocoileus virginianus*).	Genus–- no barcode
Sardines / Japanese Pilchard	*Sardinops melanostictus*	Actinopteri	Marine	The *Sardinops* genus contains only one species (although two names still exist in the databases). As such, there is not enough data to evaluate a barcode gap for species level identifications. This, combined with the geographic curation and the poorer quality identity, indicates that this result should be removed from the analysis.	Remove–- not enough data

4.2.2 Mammals

Following geographic curation, Zoetica detected eleven species of mammals through eDNA metabarcoding in the summer and fall of 2022 (**Table 4-6**, Appendix C). Detected semi-aquatic mammals include muskrat (118 sites) and beaver (34 sites), which were both detected across the LSA_{AQU} and AOI in both seasons and also at sites in the RSA_{AQU} and at reference sites in the fall. North American river otter was detected at four stream sites in the LSA_{AQU} in the fall. Of the ten detected mammalian wildlife species, muskrat detections were the most numerous (118 sites), followed by raccoon (36 sites). Mammal detections to the genus level included the genus *Odocoileus*, which includes white-tailed deer (*Odocoileus virginianus*), and *Canis*, which includes coyotes (*Canis latrans*) and domestic dogs (*Canis lupus familiaris*; Appendix B).

Of the mammal species detected, barcode gaps exist for beaver and meadow vole (Appendix A, **Table A-1**). Beaver has a barcode gap for all three primers used in this study. There was insufficient data to evaluate the presence of a barcode gap for northern short-tailed shrew, muskrat, red squirrel, and North American river otter. In addition to mammalian wildlife, the most frequent detections of other mammal species included human (55 sites) and pig (37 sites).

Table 4-6. Mammal species detected with eDNA samples collected in 2022.

Common Name	Scientific Name
Small Terrestrial Mammals	
Northern Short-tailed Shrew	*Blarina brevicauda*
Meadow Vole	*Microtus pennsylvanicus*
Raccoon	*Procyon lotor*

Common Name	Scientific Name
Red Squirrel	*Tamiasciurus hudsonicus*
Semi-Aquatic Mammals	
Beaver	*Castor canadensis*
Star-Nosed Mole	*Condylura cristata*
North American River Otter	*Lontra canadensis*
Muskrat	*Ondatra zibethicus*
Other	
Human	*Homo sapiens*
Brown Rat	*Rattus norvegicus*
Pig	*Sus scrofa*
Notes: See Appendix A for information regarding barcode gap analyses.	

4.2.3 Amphibians and Reptiles

Following geographic curation, eDNA metabarcoding detected four amphibian species – three salamanders and one frog (**Table 4-7**, Appendix D). No reptile species were detected. Both Eastern newt and wood frog were detected in the AOI. Eastern newt was the most commonly detected amphibian species (15 sites) across the AOI and LSA_{AQU}, in both seasons and all habitat types.

Wood frog has a barcode gap on all three primers used in this study (Appendix A, **Table A-1**). At this time, there is insufficient data to evaluate the presence of a barcode gap with the primers used for eastern newt and red-backed salamander. In addition, the detected genus *Lithobates*, which includes species such as wood frog and mink frog, also has a barcode gap.

Table 4-7. Amphibian species detected with eDNA samples collected in 2022.

Common Name	Scientific Name
Four-toed Salamander	*Hemidactylium scutatum*
Wood Frog	*Lithobates sylvaticus*
Eastern Newt	*Notophthalmus viridescens*
Eastern Red-backed Salamander	*Plethodon cinereus*
Notes: See Appendix A for information regarding barcode gap analyses.	

4.2.4 Birds

Following geographic curation, eDNA metabarcoding surveys in 2022 detected 21 species of birds, including upland breeding birds such as red-winged blackbird (three sites) and waterbirds such as wood duck (29 sites; **Table 4-8**, Appendix E). American robin (48 sites) and wood duck (32 sites) were the most frequently detected bird species. The Teeswater River system was mentioned during engagement as a potentially important migratory bird staging area (Zoetica 2021), and detections of waterbirds such as wood duck, mallard, and hooded merganser support this assessment. Other waterbirds were detected at the genus level, such as the genus *Branta*, which includes Canada goose (*Branta canadensis*), and the

genus *Ardea*, which includes great blue heron (*Ardea herodias;* Appendix B). The genus *Meleagris* was also detected, which includes wild turkey (*Meleagris gallopavo;* Appendix B).

A barcode gap exists on at least one primer used in the study for brown creeper, wood duck, and red-breasted nuthatch (**Table A-1**). The Hanner lab assessed hooded merganser for barcode gaps, but there was insufficient data to assess the presence of a barcode gap for the primers used in this study. At this time, mallard does not have barcode gaps for primers used in this study.

Table 4-8. Bird species detected with eDNA samples collected in 2022.

Common Name	Scientific Name
Upland Breeding Birds	
Red-Winged Blackbird	*Agelaius phoeniceus*
Hermit Thrush	*Catharus guttatus*
Swainson's Thrush	*Catharus ustulatus*
Brown Creeper	*Certhia americana*
Blue Jay	*Cyanocitta cristata*
Wood Thrush	*Hylocichla mustelina*
Savannah Sparrow	*Passerculus sandwichensis*
Indigo Bunting	*Passerina cyanea*
Rose-breasted Grosbeak	*Pheucticus ludovicianus*
Ruby Crowned Kinglet	*Regulus calendula*
Golden Crowned Kinglet	*Regulus satrapa*
Eastern Phoebe	*Sayornis phoebe*
Red-Breasted Nuthatch	*Sitta canadensis*
White-Breasted Nuthatch	*Sitta carolinensis*
Tree Swallow	*Tachycineta bicolor*
American Robin	*Turdus migratorius*
Waterbirds	
Wood Duck	*Aix sponsa*
Mallard	*Anas platyrhynchos*
Hooded Merganser	*Lophodytes cucullatus*
Virginia Rail	*Rallus limicola*
Other	
Muscovy Duck	*Cairina moschata*
Notes: See Appendix A for information regarding barcode gap analyses.	

4.2.5 Fish, Crayfish, and Mussels

Following geographic curation, eDNA metabarcoding analysis indicated the presence of 31 fish species across the AOI, LSA_{AQU}, RSA_{AQU}, and at reference sites outside of the RSA_{AQU} (**Table 4-9**, Appendix F). Central mudminnow was the most frequently detected species (154 sites), followed by creek chub (134 sites). Zoetica detected the presence of several sportfish, including sunfishes such as smallmouth bass (44 sites) and largemouth bass (2 sites). eDNA metabarcoding also indicated the presence of the genus *Esox*, which includes the species northern pike (*Esox lucius;* Appendix B).

It was noted during engagement that local people harvest crayfish in the Teeswater River (Zoetica 2021). In addition to the previously discussed rusty crayfish (Section 4.1.6) and digger crayfish (Section 4.1.4), eDNA metabarcoding indicated the presence of three native crayfish species: big water crayfish (*Cambarus robustus*), northern clearwater crayfish (*Orconectes propinquus*) and calico crayfish (*Orconectes immunis*; Appendix G). One bivalve species, creek heelsplitter (*Lasmigona compressa)*, was detected at one site in the AOI in the fall (Section 4.2.6, Appendix G). Other primary and secondary producers are included in Section 4.2.6.

Of the fish species detected, white sucker and blacknose shiner have barcode gaps on at least one of the primers used in this study.

Table 4-9. Fish, crayfish, and mussel species detected with eDNA samples collected in 2022.

Common Name	Scientific Name
Atherinopsidae – Neotropical silversides	
Brook Silverside	*Labidesthes sicculus*
Catostomidae – Suckers	
White Sucker	*Catostomus commersonii*
Shorthead Redhorse	*Moxostoma macrolepidotum*
Centrarchidae – Sunfishes	
Rock Bass	*Ambloplites rupestris*
Pumpkinseed	*Lepomis gibbosus*
Green Sunfish	*Lepomis cyanellus*
Bluegill	*Lepomis macrochirus*
Longear Sunfish	*Lepomis megalotis*
Smallmouth Bass	*Micropterus dolomieu*
Largemouth Bass	*Micropterus salmoides*
Gasterosteidae – Sticklebacks	
Brook Stickleback	*Culaea inconstans*
Ictaluridae – Catfishes	
Yellow Bullhead	*Ameiurus natalis*
Tadpole madtom	*Noturus gyrinus*
Leuciscidae – Minnows	
Northern Redbelly Dace	*Chrosomus eos*
Finescale Dace	*Chrosomus neogaeus*
Common Shiner	*Luxilus cornutus*
Hornyhead Chub	*Nocomis biguttatus*
River Chub	*Nocomis micropogon*
Golden Shiner	*Notemigonus crysoleucas*
Pugnose Shiner	*Notropis anogenus*
Blacknose Shiner	*Notropis heterolepis*
Fathead Minnow	*Pimephales promelas*
Eastern Blacknose Dace	*Rhinichthys atratulus*
Creek Chub	*Semotilus atromaculatus*
Percidae – Perches and Darters	

Common Name	Scientific Name
Rainbow Darter	*Etheostoma caeruleum*
Iowa Darter	*Etheostoma exile*
Fantail Darter	*Etheostoma flabellare*
Blackside Darter	*Percina maculata*
Salmonidae – Salmon and Trout	
Brook Trout	*Salvelinus fontinalis*
Umbridae – Mudminnows	
Central Mudminnow	*Umbra limi*
Other Fish	
Banded Killifish	*Fundulus diaphanus*
Cambaridae – Freshwater Crayfish	
Big Water Crayfish	*Cambarus robustus*
Digger Crayfish	*Fallicambarus fodiens*
Rusty Crayfish	*Faxonius rusticus*
Calico Crayfish	*Orconectes immunis*
Northern Clearwater Crayfish	*Orconectes propinquus*
Unionidae – Freshwater Mussels	
Creek Heelsplitter	*Lasmigona compressa*
Notes: See Appendix A for information regarding barcode gap analyses.	

4.2.6 Invertebrates

eDNA metabarcoding analysis in 2022 indicated 563 non-vertebrate species, including 510 insects and one diatom (class Bacillariophyceae; **Table 4-10**, Appendix G). eDNA metabarcoding detected 126 insect families and 22 non-insect families. The most detected invertebrate species (77 sites) was *Thienemanniella xena*, a midge in the Chironomidae family. Invertebrate detections included three species of conservation concern (Section 4.1.4) and five invasive species (Section 4.1.6). Rusty crayfish, an invertebrate invasive species, has a barcode gap and was detected with the Invert primer (Appendix A, **Table A-1**). In addition, eDNA metabarcoding results indicated the presence of a native earthworm species (*Sparganophilus tamesis*) in the AOI, LSA_{AQU}, RSA_{AQU}, and outside of the RSA_{AQU} (26 sites). During engagement, concerns were raised by stakeholders regarding ticks due to certain species being a vector for Lyme disease (Zoetica 2021). The rabbit tick (*Haemaphysalis leporispalustris*) was detected with eDNA, however it is not known to transmit diseases to humans (Government of Ontario 2023).

Table 4-10. Invertebrate families detected with eDNA samples in 2022, organized by class.

Arachnida				
Ixodidae	Phalangiidae

Notes:

1. Phylum: Bacillariophyta
2. Scientific name: *Lasmigona compressa*; Common name: Creek heelsplitter
3. Freshwater crayfish family; includes rusty crayfish (Section 4.1.6), digger crayfish (Section 4.1.4), big water crayfish, northern clearwater crayfish, and calico crayfish (Section 4.2.5).

5.0 DISCUSSION

To our knowledge, this eDNA project represents the densest spatial application of eDNA metabarcoding in North America and highlights a successful collaboration between industry, consulting, and academic institutions. eDNA metabarcoding during the summer and fall of 2022 indicated the presence of over 500 taxa, including five species of conservation concern (Section 4.1.4; **Figure I-1**) and six invasive or potentially invasive species (Section 4.1.6; **Figure I-2**). These findings show promise that the eDNA metabarcoding program is achieving the objectives of obtaining preliminary community composition data, locating potentially present cryptic species, identifying the distribution of biodiversity values, and providing baseline data (Section 1.1). As the summer and fall of 2022 results provide only two seasons of data within the first cycle of data collection, data cannot be used to draw conclusions about the true absence of a species; however, the species detected suggest a diverse vertebrate and invertebrate community.

Overall, the data suggested that a rich array of species use habitats that interface with aquatic habitats. Early eDNA metabarcoding data indicated potential areas of the AOI and outside of the AOI that support a higher species richness. Generally, a higher vertebrate species richness was detected across the AOI from the southwest to the northeast, and into the eastern LSA_{AQU} north of the AOI (**Figure H-1**, **Figure H-2**). This information will be useful for planning future sampling efforts and may help to inform siting of the Project to avoid species-rich areas. eDNA metabarcoding shows promise, with repeated seasonal sampling, of revealing seasonal habitat use patterns that help maintain high levels of biodiversity. For example, with repeated sampling, a pattern of higher species richness of fish in specific habitat types in the fall may suggest seasonal habitat refugia of particular importance for maintaining biodiversity. This will inform the Project about maintaining those diverse habitats and connections between them for seasonal use.

eDNA metabarcoding detected several cryptic taxa that are difficult to detect via other means. These data potentially revealed species of conservation concern including pugnose shiner, wood thrush, monarch, digger crayfish, and juniper seed moth (Section 4.1.4; **Figure I-1**) and raised the possibility of invasive species in the area (Section 4.1.6; **Figure I-2**), including three earthworms, spongy moth, rusty crayfish, and feral pig. Additional work should be undertaken to verify these results (e.g., QT PCR; Section 5.2). Overall, eDNA metabarcoding provides the start of a baseline list of present species, which can be verified, expanded, and used over the long term, with repeated sampling, to determine changes in species presence.

5.1 Current Limitations

eDNA metabarcoding is a promising emerging technology but is limited in several ways. First, the primers used may not amplify some taxa that are present in the system (Collins et al. 2019). If the DNA of a species does not amplify with the primers used, then it cannot be detected even if it is present. For example, the endangered species rainbow mussel is known to exist within the Teeswater River system (DFO 2018), but the primers used in this study did not detect it. This lack of amplification could affect entire taxa groups, possibly explaining the few amphibian detections in the eDNA results. Second, a species may not have a barcode gap for the primers used in this study, which adds uncertainty to any identifications of that species' presence from eDNA BLAST results (Pawlowski et al. 2018). However, publicly available data may not be sufficient to assess if a barcode gap exists (Ruppert et al. 2019). These issues are known as taxonomic blind spots that decrease with time as more species are sequenced and actively researched.

Other reasons that species may be present and not detected is because of eDNA degradation, a low DNA shedding rate, and distance from the organism to the sampling location (Helbing and Hobbs 2019). eDNA did not indicate the presence of pugnose shiner in Cargill Mill Pond (Section 4.1.4; **Figure I-1**), which is known to contain pugnose shiner critical habitat (COSEWIC 2013). The reasons for not detecting pugnose shiner in Cargill Mill Pond may be due to harsh conditions at the sampling locations leading to degradation of eDNA, the pugnose shiner having a naturally low DNA shedding rate, or the selected sampling locations may have been very far from where pugnose shiner occurs in the pond. Because of the discrepancy in detections and known presence, the detection of pugnose shiner in the LSA_{AQU} and the failure to detect pugnose shiner in Cargill Mill Pond warrants further investigation.

Another limitation of only two seasons of data collection, each with a single round of sampling effort, is that trends cannot yet be established or predicted. While patterns of detections were consistent between taxa groups and seasons (Section 4.1), species' ecological requirements often vary with the time of year. Further sampling will reveal if seasonal trends exist for a given taxa group or if detection patterns shift among seasons and years. In addition, covariates other than aquatic habitat type may reveal finer-scale habitat associations and requirements.

It is important to consider that eDNA detection of a species does not necessarily mean that the species was in the immediate vicinity of the sampling location, nor that the species was recently present. Similarly, it is not possible to ascertain details about the source of the DNA, such as the number of individuals, age, sex, type of cells, or if the source was alive when shedding DNA. For example, eDNA metabarcoding detection of a fish could mean that the fish was in a body of water where it was detected, or that a predator consumed that fish species elsewhere and excreted fish DNA into the body of water where eDNA sampling was conducted (Merkes et al. 2014, Guilfoyle and Schultz 2017). The DNA may also have been transported to the sampling location by the interconnections of the surface water system. The persistence, transport, and settling of eDNA affect species detections and are active areas of research. DNA behaves like fine particulate matter in water channels, meaning that downstream detections of eDNA are dependent on local hydraulic characteristics such as the depth of the water column and flow velocity (Pont et al. 2018). During the summer and fall of 2022, samples taken from streams or river sites detected the greatest number of unique species for most taxa groups (**Table 4-1**). This result may be due to the larger sample size within streams compared to sites in other aquatic habitat types (**Table 3-1**), or it may be due to the larger effective sampling area of watercourses due to the transport of DNA over longer distances compared to waterbodies and wetlands which typically have lower flow (Deiner et al. 2016). A modelling study suggests that eDNA of a fish species in a large volume river could be detected 130 km downstream from its expected source, but eDNA detection distances for watercourses with substantially less flow, such as those expected in the sampled areas of the AOI, LSA_{AQU}, and outside of the LSA_{AQU}, are orders of magnitude less (Pont et al. 2018). Understanding the effective sampling area differences between aquatic habitat types will be crucial for interpreting future analyses.

5.2 Ongoing Investigations

Barcode gaps may be required to reliably differentiate detections of closely related species. In addition, detections of unexpected species (such as those far outside their known range) could be explained by barcode gaps (Section 4.2.1). In the eDNA metabarcoding results, there are several examples where barcode gap analysis does or could clarify unexpected results. For example, eDNA metabarcoding suggests the presence of two nuthatch species in the same genus, red-breasted nuthatch and white-breasted

nuthatch (**Table 4-8**, Appendix E). Red-breasted nuthatch has barcode gaps on two of the three primers used in this study, and its presence was indicated by the Vert primer, on which it has a barcode gap (**Table A-1**). Therefore, there is increased confidence in the detection of red-breasted nuthatch. In turn, even though white-breasted nuthatch has not been assessed for barcode gaps, the detection of white-breasted nuthatch is less likely to be a misattributed detection of red-breasted nuthatch, so there is increased confidence in the detection of white-breasted nuthatch result as well.

Unexpected vertebrate species detections included humans, domestic species (Section 4.2.2), marine species, and species outside of their known ranges (Section 4.2.1). It is possible that these detections are the result of taxonomic blind spots, or that identification is biased because the unexpected species has more publicly available data than related native species. Other than barcode gap analyses, closer scrutiny of the results, such as if livestock detections occurred close to farms, may indicate why unexpected detections occurred.

In 2022, Zoetica supplied a preliminary list of detections warranting closer scrutiny to the Hanner lab for further investigation (**Table A-2**). Several of the unexpected taxa, including invasive invertebrate species red earthworm and spongy moth (Section 4.1.6) and livestock (genera *Bos, Sus, Ovis,* and *Gallus*, Section 4.2.2), showed poor evidence of barcode gaps, suggesting that eDNA metabarcoding detections of these species may not be reliable. However, the lack of a barcode gap or sufficient evidence for a barcode gap also does not automatically mean that the detection is incorrect; thus, investigation of these taxa is ongoing. Other than barcode gaps, possible explanations for detections of livestock and humans could indicate human dwellings and farms in the sampled area, interconnected via watercourses, waterbodies, and wetlands. For marine fish species commonly found in human or domestic animal diets, such as sardines, wastewater may hold enough remnant DNA from the fish, which can be detected with eDNA metabarcoding if wastewater mixes with surface water (Merkes et al. 2014). The analysis of eDNA detections is ongoing at the time of writing this 2023 BIS Baseline Report (September 2023), and further results with be discussed in future iterations of the report.

5.3 Future Directions

eDNA metabarcoding is an evolving tool to identify community composition, especially for cryptic species, and to determine where future studies should occur. Because of the uncertainty of certain eDNA metabarcoding results and current limitations in methods, detections of species of interest should be followed up by barcode gap analyses and/or traditional sampling to confirm their presence. Targeted eDNA sampling for species such as pugnose shiner and rainbow mussel may also occur to verify the presence of these species. Future reporting will include analysis of sampling covariates such as pH to determine if environmental variables are affecting eDNA results. Results included in this current version of the eDNA Appendix E, Chapter 1 of the BIS Baseline Report, will be reassessed with future data, and future analyses will include any advancements to laboratory and bioinformatics procedures. Therefore, the list of detected taxa will be enhanced as methods evolve and available data improves, refining detections and confidence in results. Continuation of the eDNA program will increase confidence in species presence, allow for identification of biodiversity hotspots, aid in identifying locations for Tier 2 studies (Section 1.1), help to inform site selection, and contribute baseline data to help determine if the Project could affect biodiversity.

APPENDIX A – BARCODE GAP ANALYSES

Table A-1. Species assessed for a barcode gap in 2022, prior to data collection.

Common Name	Scientific Name	Taxa Type	Number of Markers - Genus	Number of Markers - Species	Barcode Gap – MiFish Marker[1]	Barcode Gap – Invert Marker[1]	Barcode Gap – Vert Marker[1]	Number of Markers with Barcode Gap
Moose	*Alces americanus*	Mammal	3	NA	NA	NO	YES	1
Northern Short-tailed Shrew	*Blarina brevicauda*	Mammal	1	1	NA	NA	NA	0
Gray Wolf	*Canis lupus*	Mammal	2	2	YES	YES	YES	3
Beaver	*Castor canadensis*	Mammal	1	2	YES	YES	YES	3
Porcupine	*Erethizon dorsatum*	Mammal	NA	NA	NA	NA	NA	0
Northern Flying Squirrel	*Glaucomys sabrinus*	Mammal	1	NA	NA	YES	YES	2
Wolverine	*Gulo gulo*	Mammal	NA	NA	NA	NA	NA	0
Silver-haired Bat	*Lasionycteris noctivagans*	Mammal	NA	NA	NA	NA	NA	0
Eastern Red Bat	*Lasiurus borealis*	Mammal	NA	NA	YES	YES	YES	3
Hoary Bat	*Lasiurus cinereus*	Mammal	NA	NA	NA	NA	NA	0
Snowshoe Hare	*Lepus americanus*	Mammal	1	1	YES	NA	NA	1
River Otter	*Lontra canadensis*	Mammal	NA	NA	NA	NA	NA	0
Canada Lynx	*Lynx canadensis*	Mammal	1	NA	NA	NA	NA	0
American Marten	*Martes americana*	Mammal	NA	NA	NA	NA	NA	0
Rock Vole	*Microtus chrotorrhinus*	Mammal	1	1	NA	NA	NA	0
Meadow Vole	*Microtus pennsylvanicus*	Mammal	1	1	NA	YES	YES	2
House Mouse	*Mus musculus*	Mammal	3	3	NO	NO	NO	0
Southern Red-backed Vole	*Myodes gapperi*	Mammal	NA	NA	NA	NO	NO	0
Little Brown Myotis	*Myotis lucifugus*	Mammal	NA	NA	NA	YES	NO	1
Northern Myotis	*Myotis septentrionalis*	Mammal	NA	NA	NA	YES	YES	2
Woodland Jumping Mouse	*Napaeozapus insignis*	Mammal	NA	NA	NA	NA	NA	0
Mink	*Neovison vison*	Mammal	NA	NA	NA	NA	NA	0
White-tailed Deer	*Odocoileus virginianus*	Mammal	NA	NA	NA	NA	NA	0
Muskrat	*Ondatra zibethicus*	Mammal	3	3	NA	NA	NA	0
Fisher	*Pekania pennanti*	Mammal	NA	NA	NA	NA	NA	0
Deer Mouse	*Peromyscus maniculatus*	Mammal	NA	NA	NA	NO	NO	0
Eastern Heather Vole	*Phenacomys ungava*	Mammal	NA	NA	NA	YES	YES	2
Cougar	*Puma concolor couguar*	Mammal	NA	NA	NA	NA	NA	0
Woodland Caribou	*Rangifer tarandus*	Mammal	NA	NA	NA	NA	NA	0
Arctic Shrew	*Sorex arcticus*	Mammal	1	1	NA	NO	NO	0
Masked Shrew	*Sorex cinereus*	Mammal	1	1	NA	NO	NO	0
American Pygmy Shrew	*Sorex hoyi*	Mammal	1	NA	NA	YES	YES	2
Red Squirrel	*Tamiasciurus hudsonicus*	Mammal	1	1	NA	NA	NA	0
American Badger	*Taxidea taxus*	Mammal	NA	NA	NA	NA	NA	0
Gray Fox	*Urocyon cinereoargenteus*	Mammal	NA	NA	NA	NA	NA	0
Black Bear	*Ursus americanus*	Mammal	NA	NA	NA	NA	NA	0
Meadow Jumping Mouse	*Zapus hudsonius*	Mammal	1	1	NA	YES	YES	2
Blue-spotted Salamander	*Ambystoma laterale*	Amphibian or Reptile	NA	NA	NA	NA	NA	0
Snapping Turtle	*Chelydra serpentina*	Amphibian or Reptile	NA	NA	NA	NA	NA	0
Western Painted Turtle	*Chrysemys picta*	Amphibian or Reptile	NA	NA	NA	NA	NA	0
Gray Treefrog	*Hyla versicolor*	Amphibian or Reptile	NA	NA	NA	NA	NA	0
Mink Frog	*Lithobates septentrionalis*	Amphibian or Reptile	1	NA	NO	YES	YES	2
Wood Frog	*Lithobates sylvaticus*	Amphibian or Reptile	1	1	YES	YES	YES	3
Eastern Newt	*Notophthalmus viridescens*	Amphibian or Reptile	1	1	NA	NA	NA	0

Common Name	Scientific Name	Taxa Type	Number of Markers - Genus	Number of Markers - Species	Barcode Gap – MiFish Marker[1]	Barcode Gap – Invert Marker[1]	Barcode Gap – Vert Marker[1]	Number of Markers with Barcode Gap
Eastern Red-backed Salamander	*Plethodon cinereus*	Amphibian or Reptile	1	1	NA	NA	NA	0
Spring Peeper	*Pseudacris crucifer*	Amphibian or Reptile	NA	NA	NA	YES	YES	2
Boreal Chorus Frog	*Pseudacris maculata*	Amphibian or Reptile	NA	NA	NA	YES	YES	2
Red-sided Gartersnake	*Thamnophis sirtalis*	Amphibian or Reptile	NA	NA	NA	NO	YES	1
Eastern Gartersnake	*Thamnophis sirtalis*	Amphibian or Reptile	NA	NA	NA	NO	YES	1
Northern Goshawk	*Accipiter gentilis*	Bird	NA	NA	NA	NO	YES	1
Northern Saw-whet Owl	*Aegolius acadicus*	Bird	NA	NA	NA	YES	YES	2
Boreal Owl	*Aegolius funereus*	Bird	NA	NA	NA	YES	YES	2
Wood Duck	*Aix sponsa*	Bird	1	1	NA	YES	YES	2
Mallard	*Anas platyrhynchos*	Bird	2	NA	NO	NO	NO	0
American Black Duck	*Anas rubripes*	Bird	2	NA	NA	NO	NO	0
Eastern Whip-poor-will	*Antrostomus vociferus*	Bird	NA	NA	NA	NA	NA	0
Golden Eagle	*Aquila chrysaetos*	Bird	NA	NA	NA	YES	YES	2
Great Blue Heron	*Ardea herodias*	Bird	1	NA	NA	YES	YES	2
Short-eared Owl	*Asio flammeus*	Bird	NA	NA	NA	YES	YES	2
Long-eared Owl	*Asio otus*	Bird	NA	NA	NA	YES	YES	2
Ruffed Grouse	*Bonasa umbellus*	Bird	1	1	NA	NA	NA	0
Canada Goose	*Branta canadensis*	Bird	1	1	NA	NO	YES	1
Snowy Owl	*Bubo scandiacus*	Bird	NA	NA	NA	YES	YES	2
Great Horned Owl	*Bubo virginianus*	Bird	NA	NA	NO	YES	YES	2
Red-shouldered Hawk	*Buteo lineatus*	Bird	NA	NA	YES	YES	YES	3
Canada Warbler	*Cardellina canadensis*	Bird	NA	NA	NA	YES	YES	2
Brown Creeper	*Certhia americana*	Bird	NA	NA	NA	YES	YES	2
Chimney Swift	*Chaetura pelagica*	Bird	NA	NA	NA	YES	YES	2
Black Tern	*Chlidonias niger*	Bird	NA	NA	NA	YES	YES	2
Common Nighthawk	*Chordeiles minor*	Bird	NA	NA	NA	NA	NA	0
Evening Grosbeak	*Coccothraustes vespertinus*	Bird	NA	NA	NA	NA	NA	0
Olive-sided Flycatcher	*Contopus cooperi*	Bird	NA	NA	NA	NA	NA	0
Eastern Wood-Pewee	*Contopus virens*	Bird	NA	NA	NA	NA	NA	0
Yellow Rail	*Coturnicops noveboracensis*	Bird	NA	NA	NA	NA	NA	0
Bobolink	*Dolichonyx oryzivorus*	Bird	NA	NA	NA	NA	NA	0
Pileated Woodpecker	*Dryocopus pileatus*	Bird	NA	NA	NA	YES	YES	2
Alder Flycatcher	*Empidonax alnorum*	Bird	NA	NA	NA	NO	NO	0
Least Flycatcher	*Empidonax minimus*	Bird	NA	NA	NA	YES	YES	2
Rusty Blackbird	*Euphagus carolinus*	Bird	NA	NA	NA	NA	NA	0
Spruce Grouse	*Falcipennis canadensis*	Bird	NA	NA	YES	NA	NA	1
Peregrine Falcon *anatum/tundrius*	*Falco anatum*	Bird	NA	NA	NA	NA	NA	0
Peregrine Falcon *anatum/tundrius*	*Falco peregrinus*	Bird	NA	NA	NA	NO	YES	1
Peregrine Falcon *anatum/tundrius*	*Falco tundrius*	Bird	NA	NA	NA	NA	NA	0
Common Yellowthroat	*Geothlypis trichas*	Bird	NA	NA	NA	NA	NA	0
Bald Eagle	*Haliaeetus leucocephalus*	Bird	NA	NA	NA	YES	YES	2
Barn Swallow	*Hirundo rustica*	Bird	NA	NA	NA	NO	NO	0
Least Bittern	*Ixobrychus exilis*	Bird	NA	NA	NA	YES	YES	2
Short-billed Dowitcher	*Limnodromus griseus*	Bird	NA	NA	NA	YES	YES	2

Common Name	Scientific Name	Taxa Type	Number of Markers - Genus	Number of Markers - Species	Barcode Gap – MiFish Marker[1]	Barcode Gap – Invert Marker[1]	Barcode Gap – Vert Marker[1]	Number of Markers with Barcode Gap
Hooded Merganser	*Lophodytes cucullatus*	Bird	1	1	NA	NA	NA	0
Red-headed Woodpecker	*Melanerpes erythrocephalus*	Bird	NA	NA	NA	NA	NA	0
Common Merganser	*Mergus merganser*	Bird	NA	NA	NA	YES	YES	2
Red-breasted Merganser	*Mergus serrator*	Bird	NA	NA	NA	YES	YES	2
Black-and-white Warbler	*Mniotilta varia*	Bird	NA	NA	NA	NA	NA	0
American White Pelican	*Pelecanus erythrorhynchos*	Bird	NA	NA	NA	YES	YES	2
Horned Grebe	*Podiceps auritus*	Bird	NA	NA	NA	YES	YES	2
Red-necked Grebe	*Podiceps grisegena*	Bird	NA	NA	NA	YES	YES	2
Eared Grebe	*Podiceps nigricollis*	Bird	NA	NA	NA	YES	YES	2
Pied-billed Grebe	*Podilymbus podiceps*	Bird	NA	NA	NA	NA	NA	0
Bank Swallow	*Riparia riparia*	Bird	NA	NA	NA	NA	NA	0
Ovenbird	*Seiurus aurocapilla*	Bird	NA	NA	NA	NA	NA	0

Round Goby	*Neogobius melanostomus*	Fish	NA	NA	NA	YES	YES	2
Blacknose Shiner	*Notropis heterolepis*	Fish	2	1	NA	YES	YES	2
Spottail Shiner	*Notropis hudsonius*	Fish	2	2	YES	YES	YES	3

Common Name	Scientific Name	Taxa Type	Number of Markers - Genus	Number of Markers - Species	Barcode Gap – MiFish Marker[1]	Barcode Gap – Invert Marker[1]	Barcode Gap – Vert Marker[1]	Number of Markers with Barcode Gap
Rainbow Smelt	*Osmerus mordax*	Fish	NA	NA	YES	YES	YES	3
Sea Lamprey	*Petromyzon marinus*	Fish	NA	NA	NA	NA	NA	0
Tubenose Goby	*Proterorhinus semilunaris*	Fish	NA	NA	NA	NO	NO	0
Stone Moroko	*Pseudorasbora parva*	Fish	NA	NA	YES	NA	NA	1
Longnose Dace	*Rhinichthys cataractae*	Fish	1	NA	NA	NO	YES	1
Lake Trout	*Salvelinus namaycush*	Fish	1	NA	NO	YES	NO	1
Zander	*Sander lucioperca*	Fish	3	NA	YES	YES	YES	3
Rudd	*Scardinius erythrophthalmus*	Fish	NA	NA	NO	NO	YES	1
Wels Catfish	*Silurus glanis*	Fish	NA	NA	NA	YES	YES	2
Walleye	*Stizostedion vitreum*	Fish	NA	NA	NA	NA	NA	0
Tench	*Tinca tinca*	Fish	NA	NA	NA	NA	NA	0
Spiny Waterflea	*Bythotrephes longimanus*	Invertebrate	NA	NA	NA	NO	NO	0
Fishhook Waterflea	*Cercopagis pengoi*	Invertebrate	NA	NA	NA	NA	NA	0
Common Yabby (Crayfish)	*Cherax destructor*	Invertebrate	NA	NA	NA	NA	NA	0
Chinese Mysterysnail	*Cipangopaludina chinensis*	Invertebrate	NA	NA	NA	NO	NO	0
Asian Clam	*Corbicula fluminea*	Invertebrate	NA	NA	NA	YES	YES	2
Killer Shrimp	*Dikerogammarus villosus*	Invertebrate	NA	NA	NA	YES	YES	2
Quagga Mussel	*Dreissena bugensis*	Invertebrate	NA	NA	NA	NA	NA	0
Zebra Mussel	*Dreissena polymorpha*	Invertebrate	NA	NA	NA	YES	YES	2
Chinese Mitten Crab	*Eriocheir sinensis*	Invertebrate	NA	NA	NO	YES	YES	2
Rusty Crayfish	*Faxonius rusticus*	Invertebrate	NA	NA	NA	YES	YES	2
Bloody Red Shrimp	*Hemimysis anomala*	Invertebrate	NA	NA	NA	NA	NA	0
Golden Mussel	*Limnoperna fortunei*	Invertebrate	NA	NA	NA	YES	YES	2
Channeled Apple Snail	*Pomacea canaliculata*	Invertebrate	NA	NA	NA	NO	NO	0
New Zealand Mud Snail	*Potamopyrgus antipodarum*	Invertebrate	NA	NA	NA	YES	YES	2
Red swamp Crayfish	*Procambarus clarkii*	Invertebrate	NA	NA	YES	YES	NO	2
Marmorkrebs (Marbled Crayfish)	*Procambarus virginalis*	Invertebrate	NA	NA	NA	NO	NO	0
Banded Mysterysnail	*Viviparus georgianus*	Invertebrate	NA	NA	NA	NA	NA	0

Notes:
This list includes species from both siting areas under consideration for the Project (see Section 1.0, Chapter 1).

1. Barcode gap results are reported in three possible outcomes: *NA* is due to insufficient data to evaluate the presence of a barcode gap; *Yes* indicates the presence of a barcode gap given the available data; *No* is the absence of a barcode gap given the available data.

Table A-2. Barcode gaps for unexpected species detected with eDNA samples collected in 2021-2022.

Common Name	Scientific Name	Taxa Type	Native Range	12S	COI-Vert	COI-Invert	Notes
Varied Thrush	*Ixoreus naevius*	Bird	North America[1]	NA	NA		Insufficient Data
American Eel	*Anguilla rostrata*	Fish	North America[1]	NA		Yes	Data available for 17 species in the Genus, 0 with insufficient data, 5 with no barcode gap, the remaining 12 have gaps. This species does have a barcode gap.
Atlantic Herring	*Clupea harengus*	Fish	Marine	NA	No		Data for only two species both marine. This needs to be assessed at a higher taxonomic level.
Escolar	*Lepidocybium flavobrunneum*	Fish	Marine	NA	NA		Insufficient Data
Atlantic Mackerel	*Scomber scombrus*	Fish	Marine	NA	Yes		Data available for 4 species in the Genus, 0 with insufficient data, 3 with no barcode gap, the remaining 1 has a gap and is the target species.
European Chub	*Squalius cephalus*	Fish	Europe	NA	No		Data available for 28 species in the Genus, 8 with insufficient data, 10 with no barcode gap, the remaining 10 have a gap. This species does not have a barcode gap.
Fall Fish	*Semotilus corporalis*	Fish	North America[1]	Yes	Yes		COI - Data available for 3 species in the Genus, 1 with insufficient data, 0 with no barcode gap, the remaining 2 have a gap. This species does have a barcode gap. 12S - Data for two species available, and both have gaps.
PumpkinSeed	*Lepomis gibbosus*	Fish	North America[2]	NA	Yes		Data for 9 species, and all species have barcode gaps.
Bluegill	*Lepomis macrochirus*	Fish	North America[2]	NA	Yes		Data for 9 species, and all species have barcode gaps.
Permanent Marsh Mosquito	*Anopheles walker*	Invertebrate	North America	NA		No	
Spongy Moth (LDD Moth)	*Lymantria dispar*	Invertebrate	Invasive[1]			No	Data available for 51 species in the Genus, 15 with insufficient data, 14 with no barcode gap, the remaining 22 have gaps. This species does not have a barcode gap.
Red Earthworm	*Lumbricus rubellus*	Invertebrate	Invasive			No	Data available for 9 species in the Genus, 2 with insufficient data, 3 with no barcode gap, the remaining 4 have gaps. This species does not have a barcode gap.
Octagonal tail-worm	*Dendrobaena octaedra*	Invertebrate	Invasive			No	Data available for 15 species in the Genus, 7 with insufficient data, 6 with no barcode gap, the remaining 2 have gaps. This species does not have a barcode gap.

Notes:
In most cases, invertebrates were assessed for a barcode gap on the COI-Invert primer only, and vertebrates were assessed for a barcode gap on 12-S (MiFish) and the COI_Vert primers.
Barcode gap results are reported in three possible outcomes: *NA* is due to insufficient data to evaluate the presence of a barcode gap; *Yes* is the presence of a barcode gap given the available data; *No* is the absence of a barcode gap given the available data; blank is the marker was not assessed for a barcode gap for the species in question.

1. Detection is outside of the species' known range.
2. Pumpkinseed and bluegill are included to determine if barcode gaps can differentiate them.

APPENDIX B – DETECTIONS TO THE GENUS LEVEL

Table B-1. 2022 eDNA detections with genera as the final result.

Genera	Order
Mammals	
Not Detected at Species Level	
Bos	Artiodactyla
Ovis	Artiodactyla
Odocoileus	Artiodactyla
Equus	Perissodactyla
Canis	Carnivora
Amphibians	
Detected at Species Level	
Lithobates	Anura
Birds	
Not Detected at Species Level	
Anser	Anseriformes
Aquila	Accipitriformes
Ardea	Pelecaniformes
Branta	Anseriformes
Butorides	Pelecaniformes
Columba	Columbiformes
Corvus	Passeriformes
Eremophila	Passeriformes
Gallus	Galliformes
Hirundo	Passeriformes
Junco	Passeriformes
Meleagris	Galliformes
Melospiza	Passeriformes
Passer	Passeriformes
Phalacrocorax	Pelecaniformes
Sturnus	Passeriformes
Troglodytes	Passeriformes
Zonotrichia	Passeriformes
Detected at Species Level	
Agelaius	Passeriformes
Turdus	Passeriformes
Fish	
Not Detected at Species Level	
Clupea	Clupeiformes
Cottus	Perciformes
Esox	Esociformes
Pomoxis	Centrarchiformes
Detected at Species Level	
Catostomus	Cypriniformes
Chrosomus	Cypriniformes
Etheostoma	Perciformes
Lepomis	Centrarchiformes
Micropterus	Centrarchiformes
Moxostoma	Cypriniformes
Nocomis	Cypriniformes
Percina	Perciformes
Rhinichthys	Cypriniformes
Salvelinus	Salmoniformes
Umbra	Esociformes
Invertebrates	

Genera	Order
Not Detected at Species Level	
Acalymma	Coleoptera
Acricotopus	Diptera
Acylomus	Coleoptera
Alluaudomyia	Diptera
Anisodactylus	Coleoptera
Apallates	Diptera
Aphodius	Coleoptera
Apocephalus	Diptera
Atarba	Diptera
Axarus	Diptera
Bezzia	Diptera
Bourletiella	Symphypleona
Brachydeutera	Diptera
Buenoa	Hemiptera
Carpelimus	Coleoptera
Chelifera	Diptera
Chlaenius	Coleoptera
Chrysoperla	Neuroptera
Chrysotus	Diptera
Clinohelea	Diptera
Clinotanypus	Diptera
Condylostylus	Diptera
Coniopteryx	Neuroptera
Cordyla	Diptera
Cuterebra	Diptera
Cymbiodyta	Coleoptera
Cypria	Podocopida
Delia	Diptera
Diamesa	Diptera
Dicerca	Coleoptera
Dicranophragma	Diptera
Dictya	Diptera
Digrammia	Lepidoptera
Dilophus	Diptera
Dixella	Diptera
Donacaula	Lepidoptera
Einfeldia	Diptera
Epicauta	Coleoptera
Epicypta	Diptera
Epuraea	Coleoptera
Eristalinus	Diptera
Erythridula	Hemiptera
Forcipomyia	Diptera
Geranomyia	Diptera
Gomphus	Odonata
Gonomyia	Diptera
Graphomya	Diptera
Heleniella	Diptera
Helina	Diptera
Helobdella	Rhynchobdellida
Hemerobius	Neuroptera
Hydrodroma	Trombidiformes
Hypena	Lepidoptera
Hypnoidus	Coleoptera

Genera	Order
Kellicottia	Ploima
Krenopelopia	Diptera
Kurzia	Diplostraca
Laphria	Diptera
Lethocerus	Hemiptera
Leucrocuta	Ephemeroptera
Limnophila	Diptera
Linopodes	Trombidiformes
Lonchoptera	Diptera
Lucilia	Dipetra
Lygus	Hemiptera
Macronychia	Diptera
Medetera	Diptera
Melanostoma	Diptera
Melanotus	Coleoptera
Monohelea	Diptera
Nebrioporus	Coleoptera
Nemotelus	Diptera
Neoscutopterus	Coleoptera
Neozavrelia	Diptera
Oberea	Coleoptera
Ochthera	Diptera
Oscinella	Diptera
Palpomyia	Diptera

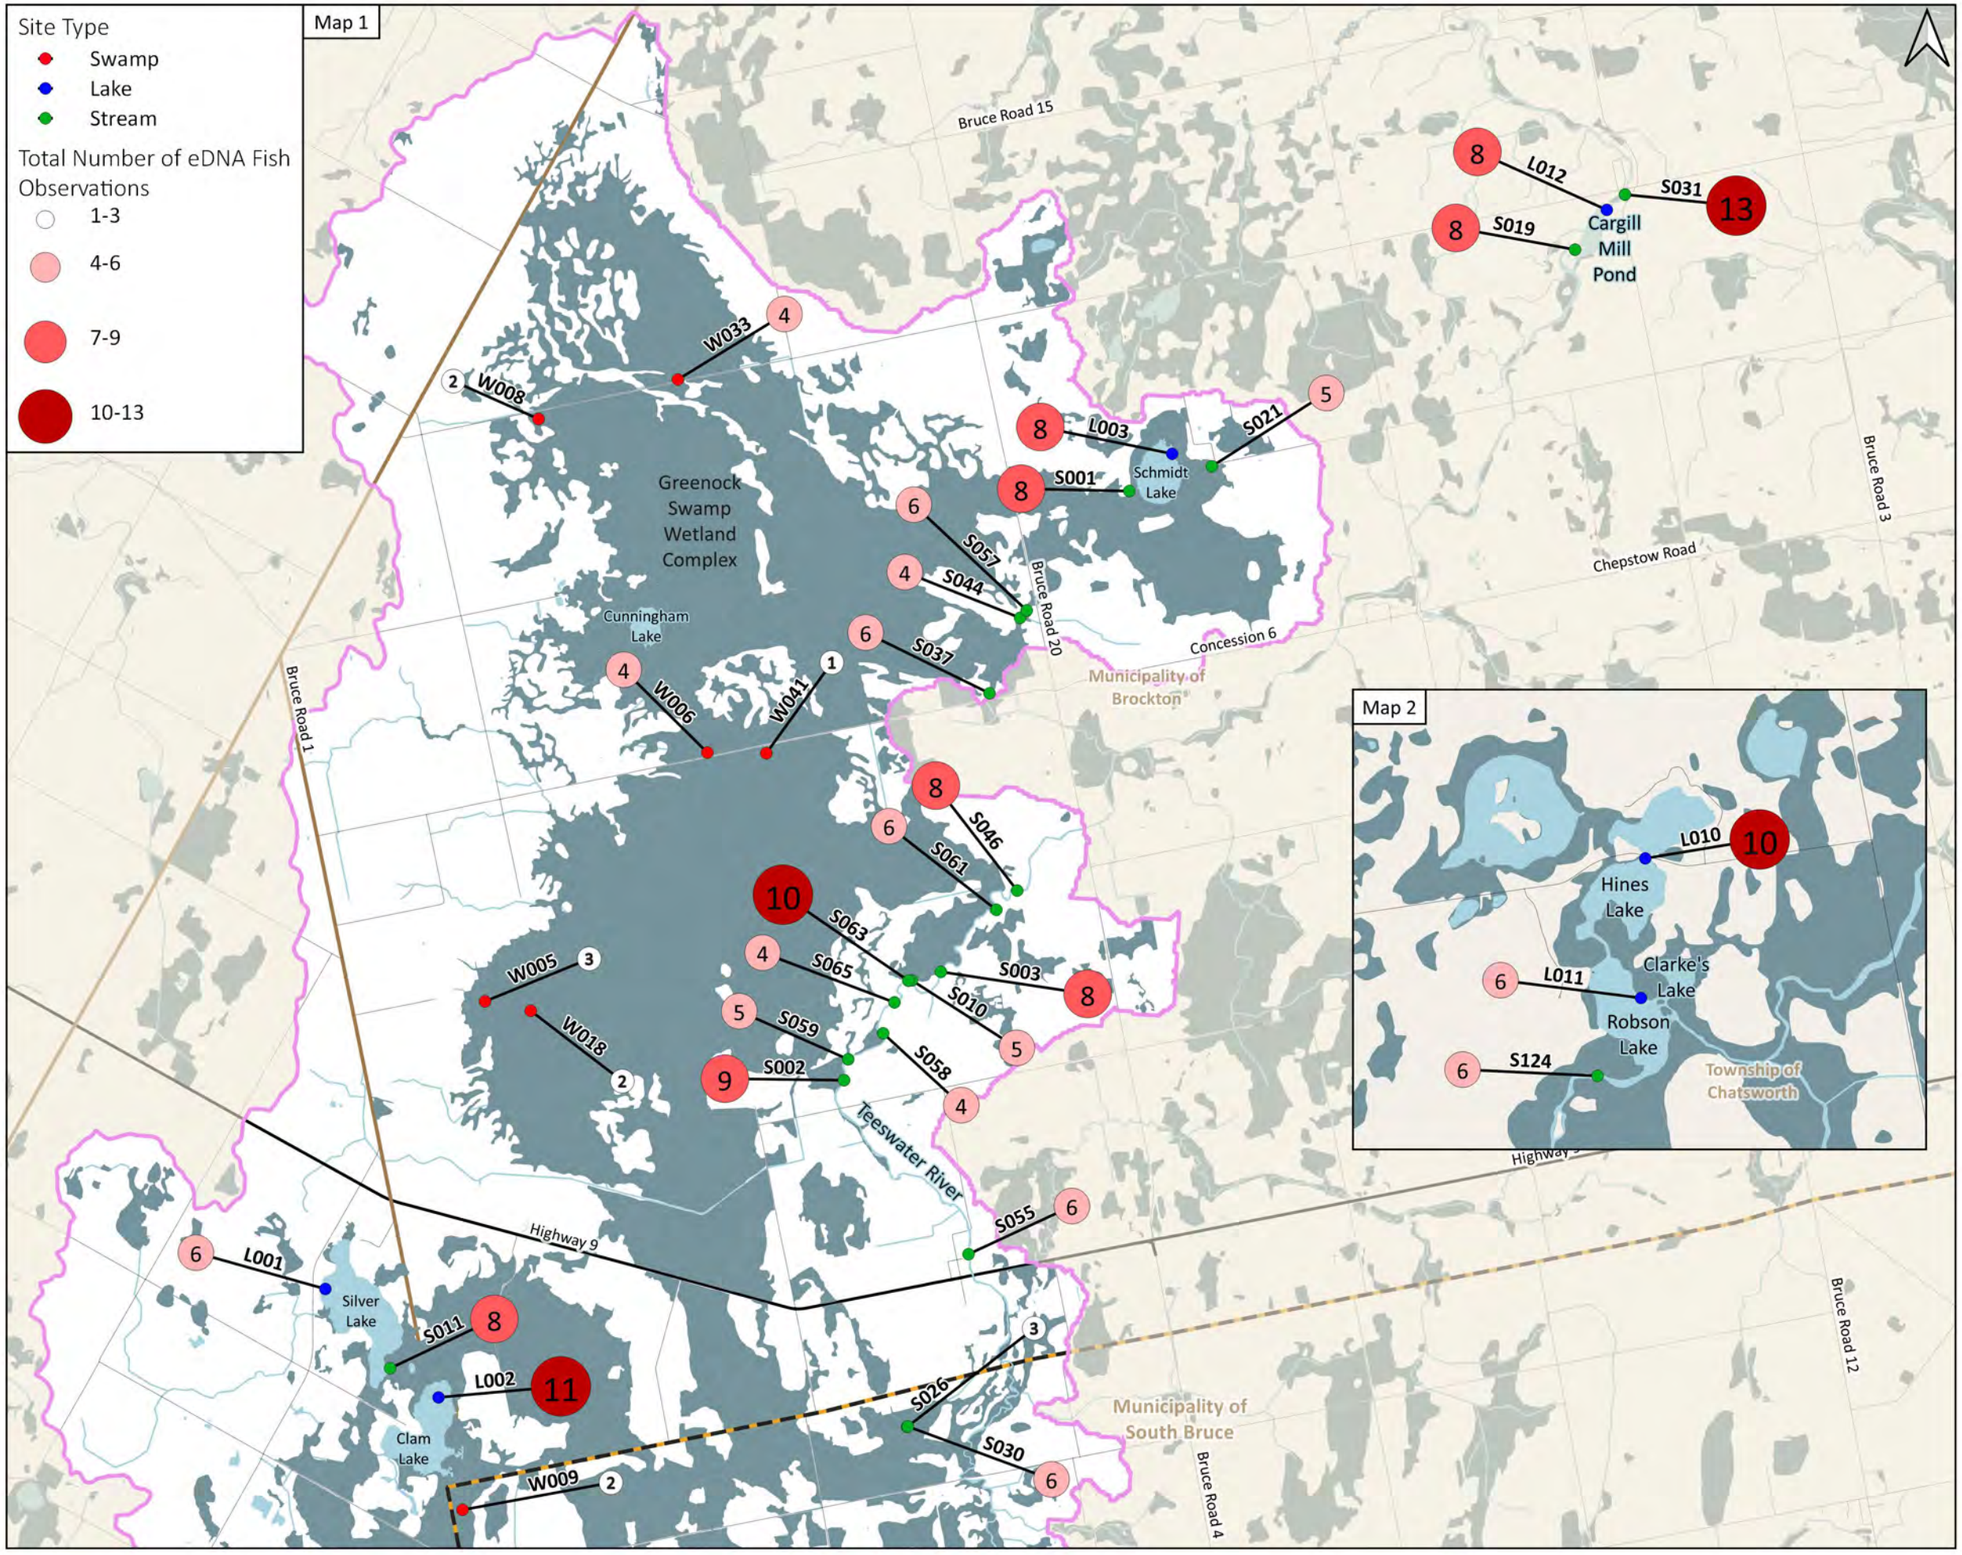
F.2 Fall

NWMO Biodiversity Impact Studies

Total Fall Results (Fish) - North LSA_{AQU}

Figure F-2a

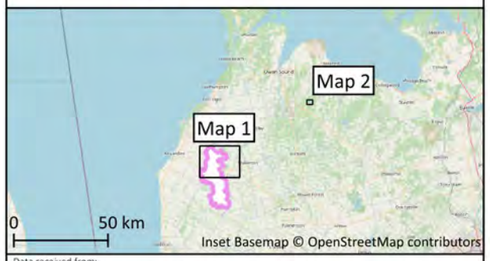


Area of Interest (AOI)
Local Study Area (LSA_{TER})
Local Study Area (LSA_{AQU})
Lake
Wetland
Watercourse
Highway
Local Road
South Bruce Boundary
Municipal Boundary

The number inside the observation symbols represents the count of detected species at that given site.

1:65,000
0 1 2 km

ZOETICA



Data received from:
Ontario GeoHub — OHN Waterbody (MNRF); OHN Watercourse (MNRF); MNRF Road Segments (MNRF); Municipal Boundary - Lower and Single Tier (MMAH); Wetlands (MNRF)
NWMO — AOI; 2022 SB eDNA Rev. B (NSC)
Wetlands and water features are mapped using ecosite data within the LSA_{ECO} and data available from Ontario GeoHub outside the LSA_{ECO}.

Project CRS: NAD83 / UTM zone 17N		
Author: AH	Reviewed by: CW	Approved by: HB
December 13, 2023	Map ID: NWMO_BIS_A109a
